A Valuable New Book on an Important Trade

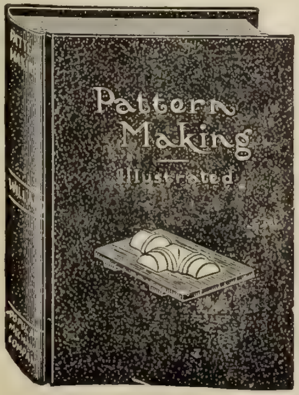
PATTERN-MAKING
By G. H. WILLARD

Two Significant Opinions:

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

224 Pages. 312 Illustrations. Cloth Cover.



With Additional Chapters on Core-Making and Molding

"WRITTEN SO YOU CAN UNDERSTAND IT."

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

Chapter Headings

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding Pattern Work.

Part II.—Core-Making and Molding.

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

STEEL CASTINGS

Of the Highest Prevalent Quality

We make perfect castings at a price that is right.
NEW PROCESS CONVERTER STEEL CASTINGS, annealed and unannealed.
We also make CHROME-MANGANESE AND NICKEL STEEL CASTINGS.
Any size from quarter lb. to 30,000 lbs., absolutely guaranteed.

GET OUR ESTIMATES.

JOLIETTE STEEL CASTING WORKS, Ltd.
Head Office and Foundry: JOLIETTE, P.Q.

Casting for a 10,500 H.P. Water Wheel

High-Speed Steam-Hydraulic Forging Presses

Double your production with one-half your labor cost and steam consumption Cost of repairs reduced. Eliminates heavy shocks and vibration.

"SINGLE LEVER CONTROL"

Small sizes—single-frame type. Large sizes—four-column type.
Built for doing all classes of forging, shearing or pressing

100 Tons to 12,000 Tons Capacity

"Hercules," the Strongest of Them All

No name could better fit our High Speed Hot Twist Drills. They are strong, tough, durable—**right**. Owing to the method of twisting while hot, "Hercules" Drills do not lose their "grain." They hold an edge long after the ordinary milled drill has become too dull to use.

Only High Percentage Vanadium High Speed Steel is used in "Hercules" Drills, thereby assuring satisfactory results **every time.**

Our complete line of High Speed Twist Drills and Reamers shown in Catalog No. 82 D furnished on request.

The Right Chuck For Every Job

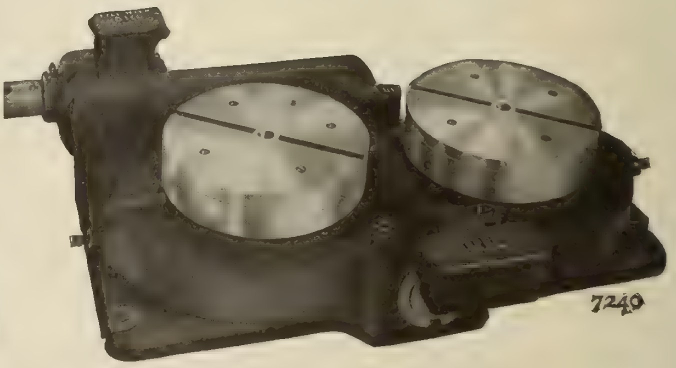
RECTANGULAR MAGNETIC CHUCK

It has been proved that for certain classes of surface grinding the rotary chuck is most efficient and for others the rectangular reciprocating chuck gives the best results. This combination of chucks is furnished exclusively on the

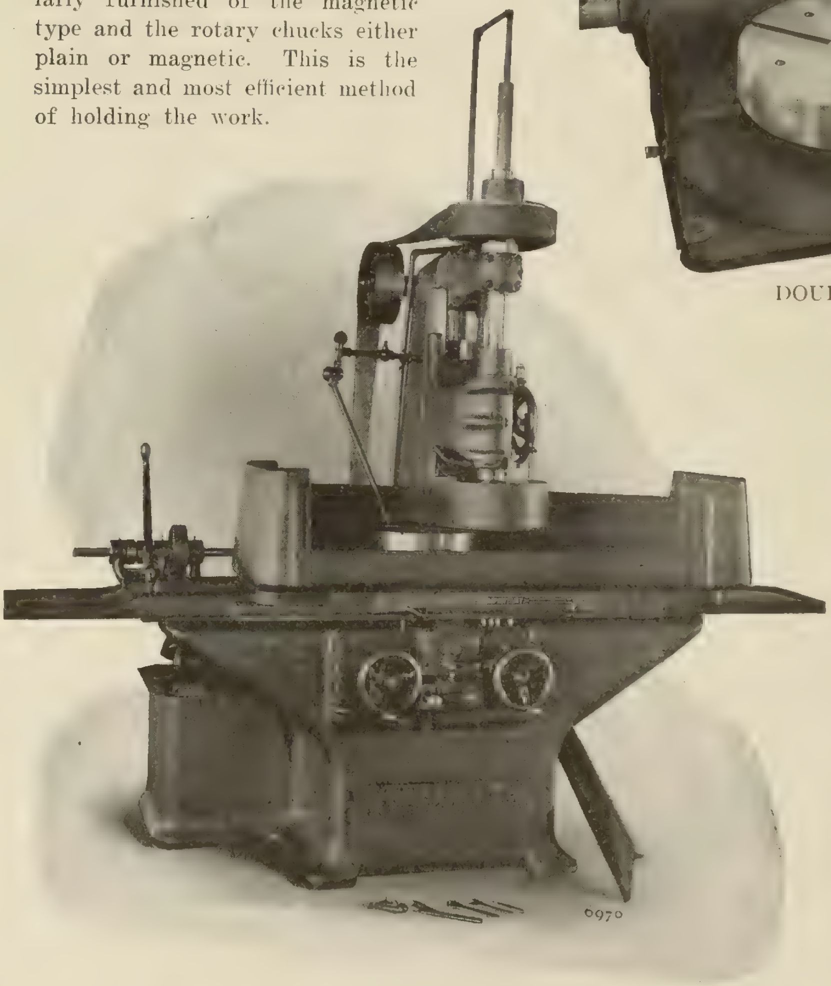
P. & W. Vertical Surface Grinder

Both Chucks Furnished of the Magnetic Type

The rectangular chuck is regularly furnished of the magnetic type and the rotary chucks either plain or magnetic. This is the simplest and most efficient method of holding the work.



DOUBLE ROTARY CHUCK



Rotary Chucks Most Efficient on Circular Work

Your circular work such as gear blanks, washers, rings, discs, etc., can be most efficiently handled by the rotary chucks, a single piece being placed at the centre of the chuck.

We furnish single, double and quadruple chucks, depending on the output you wish to make on each machine. The single and double rotary chucks can be tilted to an angle for concave and convex work.

Rectangular Reciprocating Chucks for Other Flat Work

For the rest of your work, the rotary chuck is readily removed and the rectangular chuck substituted.

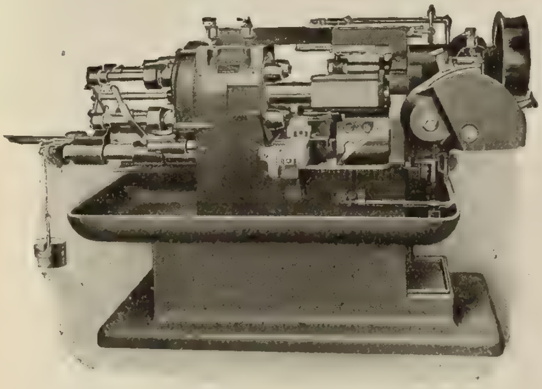
Now, Suppose Two Machines Were Brought Before You—

one will accomplish certain work in **one** operation, but the same work done on the other machine would require **two** operations or even **three**. Other things be equal, which machine would you choose?

"GRIDLEY" Multiple Spindle



The "Gridley" Automatic is the "short route" machine for modern **shops** because it permits using tools tandem, an arrangement which often allows you to accomplish two or three times more work in a given time than would be possible with other machines.

Other reasons, too—for instance: "Gridley" tools do not overhang, are held close to the work, so **heavier cuts and coarser feeds** are possible, and, as there is ample room on the "Gridley" Automatic to attach "special tools," **it will handle work fully twice the length** that other machines will.

We manufacture both Multiple and Single Spindle Automatics.

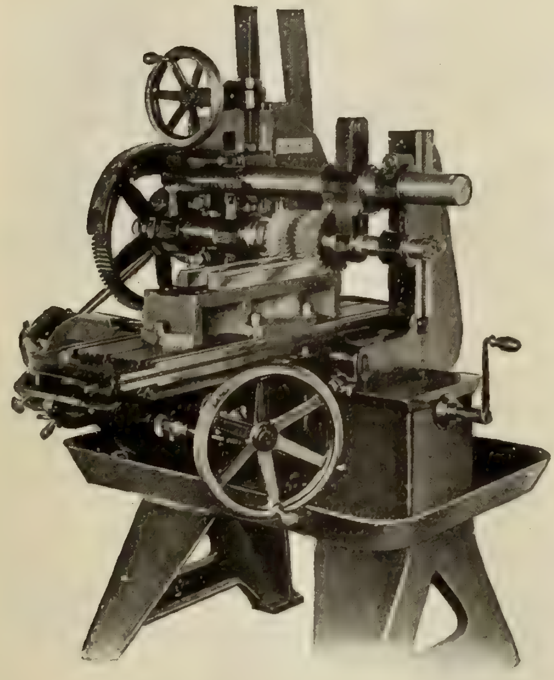
The largest special manufactory for the construction of Boring and Milling Machines



KEMPSMITH No. 32

Lincoln Type Milling Machine

Built for rapid production of duplicate parts.

The cut at the left shows machine taking roughing cut over top and sides of two gibs set in parallel. Work is clamped from beneath.

Spindle speed 30 r.p.m.

Feed per revolution .120 in.

Table travel 3.6 in. per minute.

This machine is especially adapted to comparatively heavy gang milling. The two step cone is driven by 3½ in. double belt. The back gear ratio is constant 5 to 1, and the rigid arbor support prevents cutters being knocked out of line by heavy cuts.

Further details regarding this machine gladly furnished.

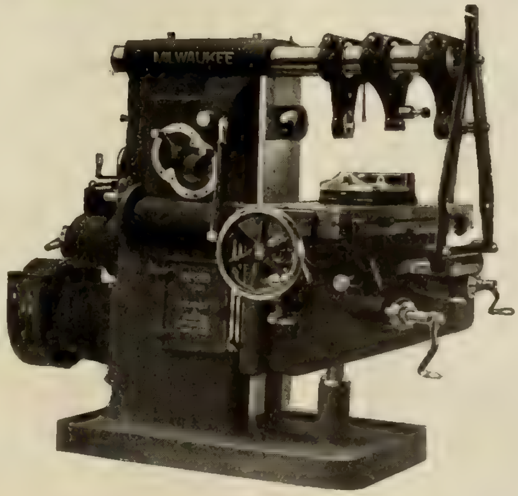
KEMPSMITH MFG. COMPANY, Milwaukee, Wis.

WHY MILWAUKEE MILLERS

Are Built Exactly As They Are

No. 7—

Arm Braces



If you have had experience with milling machines on which heavy, cumbersome braces are used, you will probably have noticed a tendency on the part of the workmen not to use the braces.

There is a definite purpose for braces—as a light tie to equalize the strain between the arbor bearings and the knee, checking vibration.

By leaving off the braces your men fail to check this vibration and thereby endanger the quality of your work.

That is why we make our arm braces light and easily applied instead of heavy and cumbersome.

This is the seventh well-defined "WHY" in favor of Milwaukee Millers. All these "WHYS" are consolidated and elaborated in our Bulletins. Shall we mail you copies?

Increased Output And Economy Always Result From Using

No. 2 Plain High Power ROCKFORD MILLING MACHINE

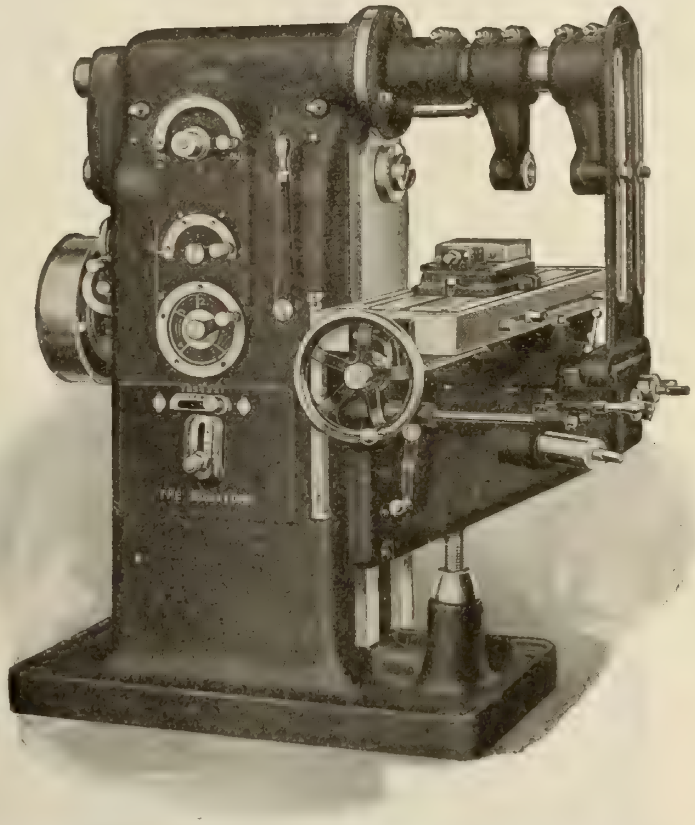
One lever automatically controls all feeds.

Constant Drive, Feed changes and Feed variations are within easy reach of the operator.

Power is delivered from belt to main spindle with a minimum of friction loss by using High Duty Hyatt Roller Bearings.

An investigation will prove of utmost value to you.

Rockford Milling Machine Co.
ROCKFORD, ILLINOIS, U.S.A.



The Geometric Adjustable Hollow Milling Tool

Practical Durable Economical

Made in sizes from 7-16-inch to 4-inch. Especially designed for Brass Finishing and for reducing duplicate parts to an exact diameter prior to threading.

Also for light cutting on cast iron, steel and similar material.

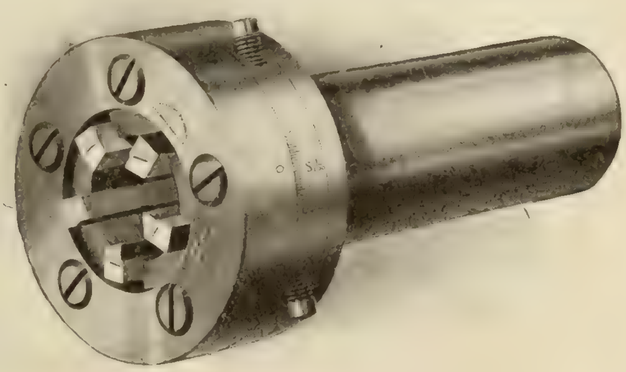
We furnish special tools of this class to meet special working conditions.

The cutters project as far from the face of the cam as practicable, which permits of milling right up to a shoulder where necessary. This makes the cutters very long-lived, as they may be ground repeatedly.

Submit your proposition to us. Send for Descriptive Circular.

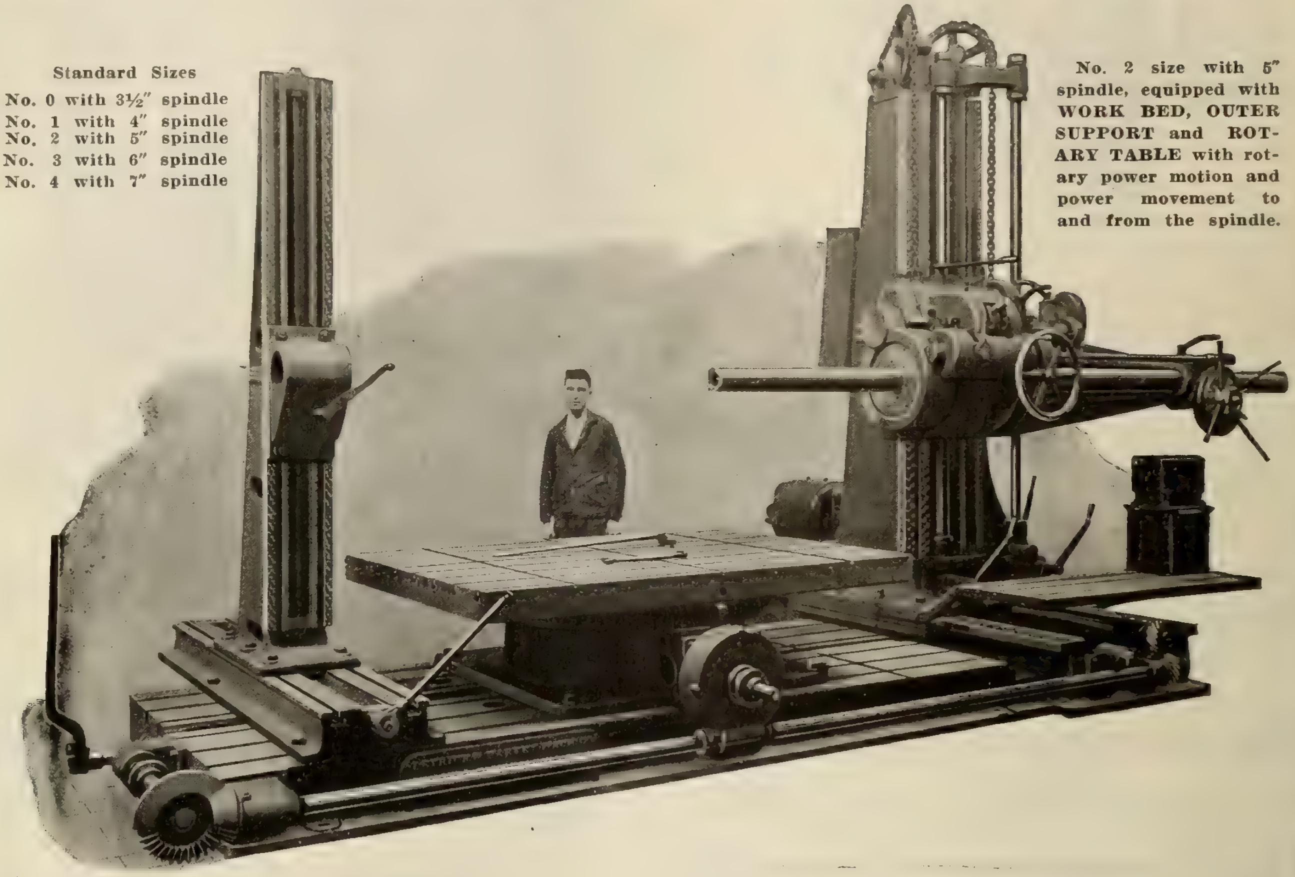
THE GEOMETRIC TOOL COMPANY,
NEW HAVEN, CONN.

Canadian Agents: Williams & Wilson, Montreal. The A. R. Williams Machinery Co., Toronto.



All The Work At One Chucking

Standard Sizes
No. 0 with 3½" spindle
No. 1 with 4" spindle
No. 2 with 5" spindle
No. 3 with 6" spindle
No. 4 with 7" spindle



No. 2 size with 5" spindle, equipped with WORK BED, OUTER SUPPORT and ROTARY TABLE with rotary power motion and power movement to and from the spindle.

IT is far easier, quicker and better to finish the different operations at one chucking than to waste the time and effort transferring the work from one machine to another.

By using the rotary table in connection with our machine you can perform *all the operations* on the different sides of the work, no matter how large or irregular in shape, *without rechucking.*

Valuable Features

1. **Centralized Control.** All movements fast and slow by hand and power are **non-conflicting**, any feed and traverse, the starting, stopping or reversing of the machine, or changing from one operation to another can be made at the front of the machine.

2. **The Narrow Guiding Fits** of the Column to runway and of saddle to column, reduce the friction of the machine, the strain on the feed mechanism and retain alignment to moving parts.

3. **Additional Friction Device,** for retaining spindle in its horizontal position against the pressure of cut when milling.

4. **No Belts Used.** All gear driving and feeding mechanism.

5. **All Feeds** are driven by the spindle and are always within a given ratio to spindle speeds.

DETRICK & HARVEY MACHINE COMPANY

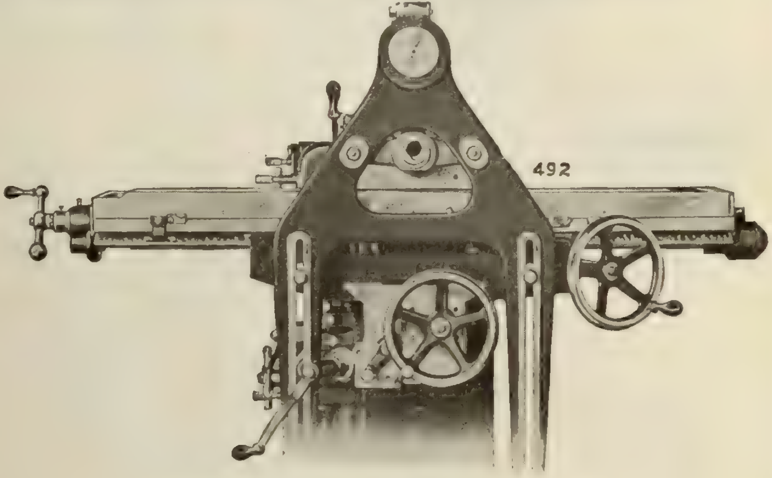
BALTIMORE, MARYLAND, U. S. A.

Cincinnati Rigidity

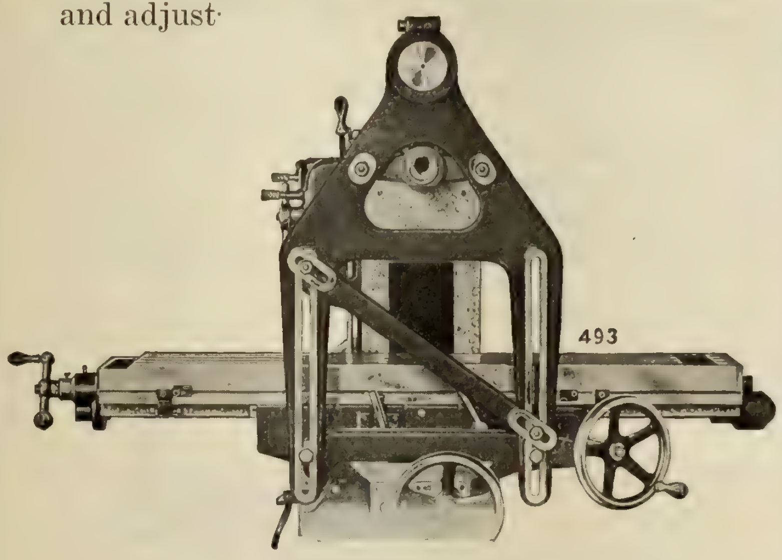
The weakest parts of any Column and Knee Type Miller are the arbor, knee and arbor supports. Their importance is emphasized by the various efforts of designers to strengthen them. The size of arbor is determined by the cutters and is therefore beyond the designer's control. For years we have been recommending the use of large arbors, because all parts of our machines are stronger than the largest arbors in use.

The practical problem resolves itself into providing the greatest rigidity in the other members by making the strongest continuous structure of the Column, Knee, Brace and Overarm.

Thorough experiments and careful analyses have shown us that the resultant of the pressures against the outer arbor supports (the braces and overarm) on ordinary work is nearly in a horizontal plane. We designed our braces to resist such pressures, and did not forget to make them, and the arbor bearing, as handy as possible to set up and adjust·



Usual position of Table when doing heavy cutting



Unusual position of Table
Braces provided with an additional truss member

We employ a single piece triangle. It is always a triangle. Its form is not changed by different positions of the table. In the lower positions the greatest rigidity is needed, and then we add another truss member, making it a double triangle.

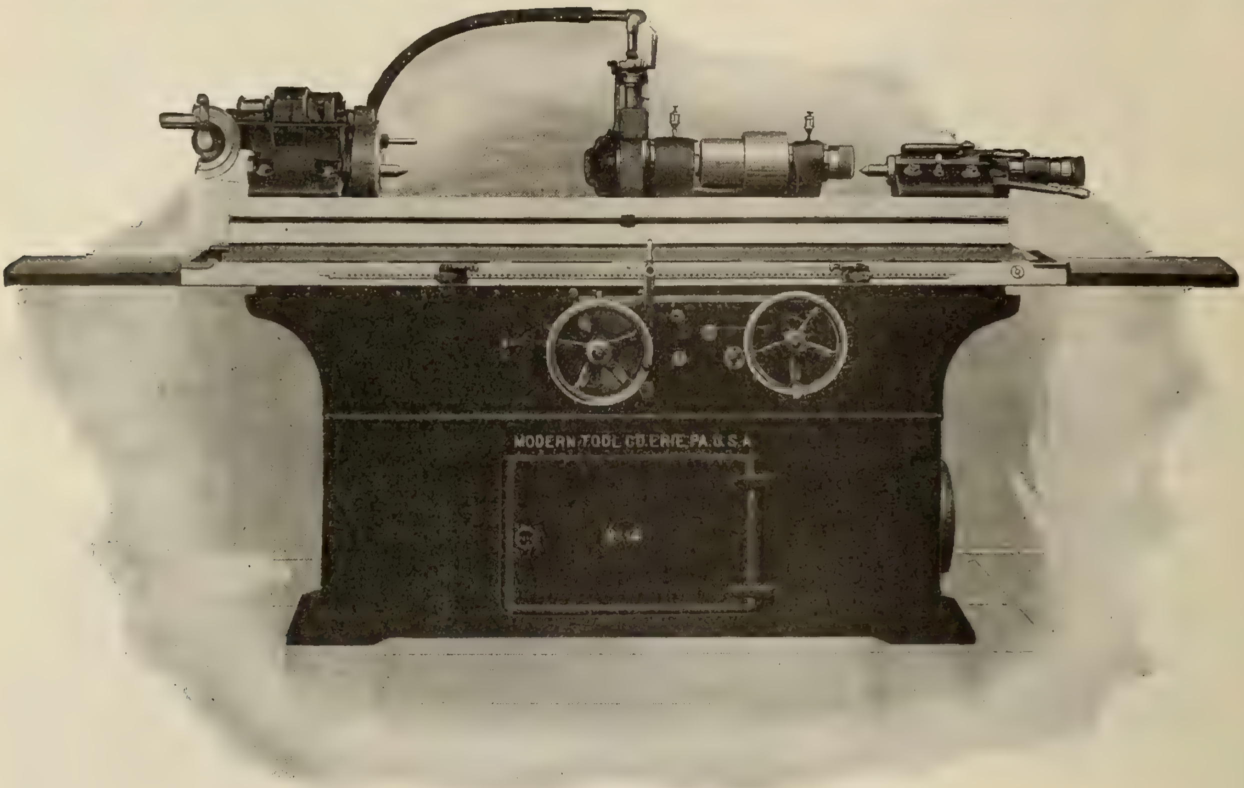
The upper ends of the usual two-piece form of triangular braces do not cross when the table is low and they no longer form a triangle at the very time when it is needed most. Ours, being made in one piece, is handy to attach or remove. It is easy to slide it, as well as the arbor supports, along our large cylindrical arm. This contributes to that handiness in "setting up" that makes our machine more productive.

THE CINCINNATI MILLING MACHINE CO.

CINCINNATI OHIO, U. S. A.

Canada Agent : H. W. Petrie, Ltd., Toronto and Montreal.

MODERN GRINDERS



No. 14 Plain. Capacity 12-in. x 44-in. Wheel 2-in. x 18-in.

Great strength and rigidity is assured by the heavy base with metal flowed correctly to absorb vibrations and prevent springing.

Accessibility—the driving and reversing mechanism is contained in a bracket bolted to the outside of the machine. Instantly accessible for oiling and repair.

Large wearing surfaces—all wearing surfaces are large and located away from grit and water.

Automatic cross feed gives a range of from .00025″ to 004″.

Changes—the work can be stopped or started—changes of work speeds made instantly, by use of lever on head stock.

Modern Grinders are built in Plain, Universal and Internal types. Unexcelled in accuracy, speed and durability.

Write for catalog immediately.

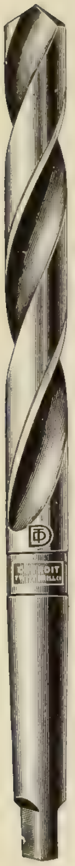
Trade Mark

Between You And Any Loss

Our trade-mark stands between you and any possible loss for all "Detroit" Tools are sold on a satisfaction guaranteed basis. Every one should come up to the "Detroit" standard of goodness and we employ an exacting system of supervision to maintain that standard.

If an occasional one slips past the inspector and you get one which proves defective, we'll thank you to return it. You'll get another free of charge—post haste.

An efficiency expert recently made the statement that the two most essential characteristics of a tool are durability and adaptability.



Trade Mark

Look for our Trade Mark —the High Efficiency Sign

Trade Mark

"Detroit" Twist Drills

and other small tools are all made with these two points in view. The best small tool steel, that best adapted to the special use for which a certain tool is made, correct design, supplemented by intelligent workmanship, 27 years' experience, exact heat treatment in our automatic electric furnaces and every modern facility insure strength, efficiency, durability and adaptability.

Adaptability is the ability to meet conditions—your working conditions. You don't care what a tool will do for Jones or Smith or Brown—it must meet your demands. That's why we ask you to test them in your plant under your particular working conditions.

"Detroit" Drills are made in all sizes and styles: grooved and taper shank, carbon and high-speed steel. Go to your Dealer. Get some on trial. A good stiff test will convince you—and you get your money back if it doesn't.

Our new Catalog "R" is just off the press. It contains much valuable information and is specially arranged for speedy reference.

Write for it to-day.

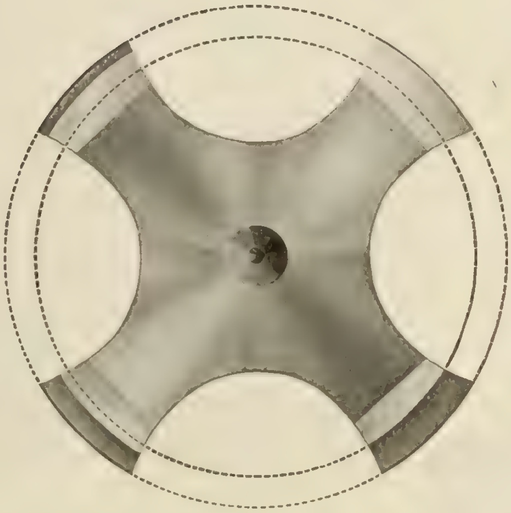
A Tale of Two ~~Cit~~ Taps

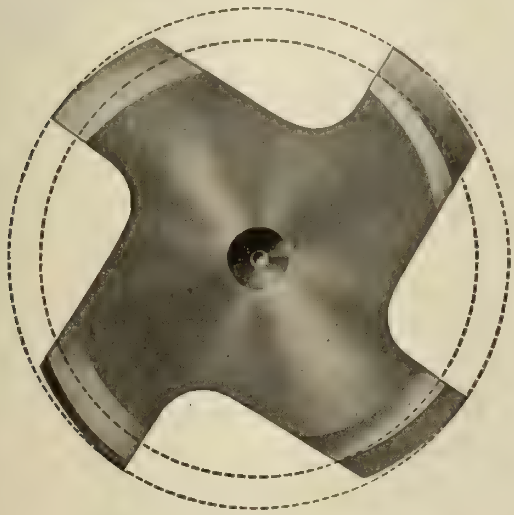
Grandfather

designed this tap years ago ☛

and when he did it was a mighty good tap—a whole lot better than *none,* which was all we had before. Today there are *some* grandsons making taps in the same design, but experience has developed at least one weak point in it; viz:—

Behind each cutting edge is a vast surface which doesn't *help* anybody or anything—it merely drags, scrapes and scratches along in the newly cut thread-grooves, roughing up the work and creating a lot of friction and heat that is altogether unnecessary.





Grandson

taking his cue from Grandfather's experience, set out to do away with that friction.

He built a *relief* into every tooth on the tap: Result—The cutting edge cuts keener and easier. The support is just as solid but don't scratch, drag or heat.

☚ You can *see* for yourself.

Hence we have the

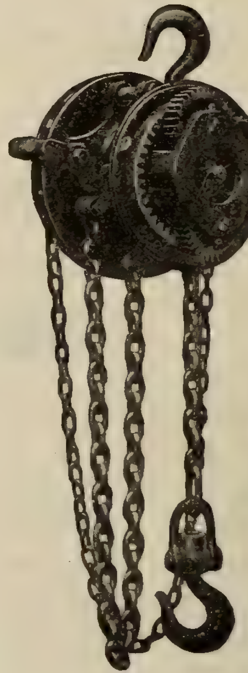
"STEEL HOISTS NEVER BREAK."

Standard High Speed Steel Hoist

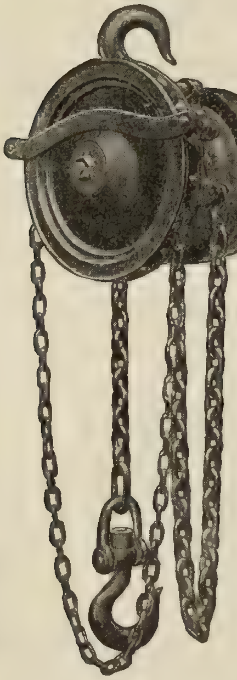
A Special Foundry Hoist



A hoist especially adapted to your foundry work. By a special construction we do away entirely with the customary jerking and slipping in the lowering of the load, thus eliminating the jarring of the sand from the mold. And a hoist that satisfies the foundry trade will satisfy any trade.

STEEL PARTS.
GUARANTEED THROUGHOUT.

Every Hoist Tested to 50 Per Cent. Overload Before Leaving Factory.



"Special Quick Lift Hoist"

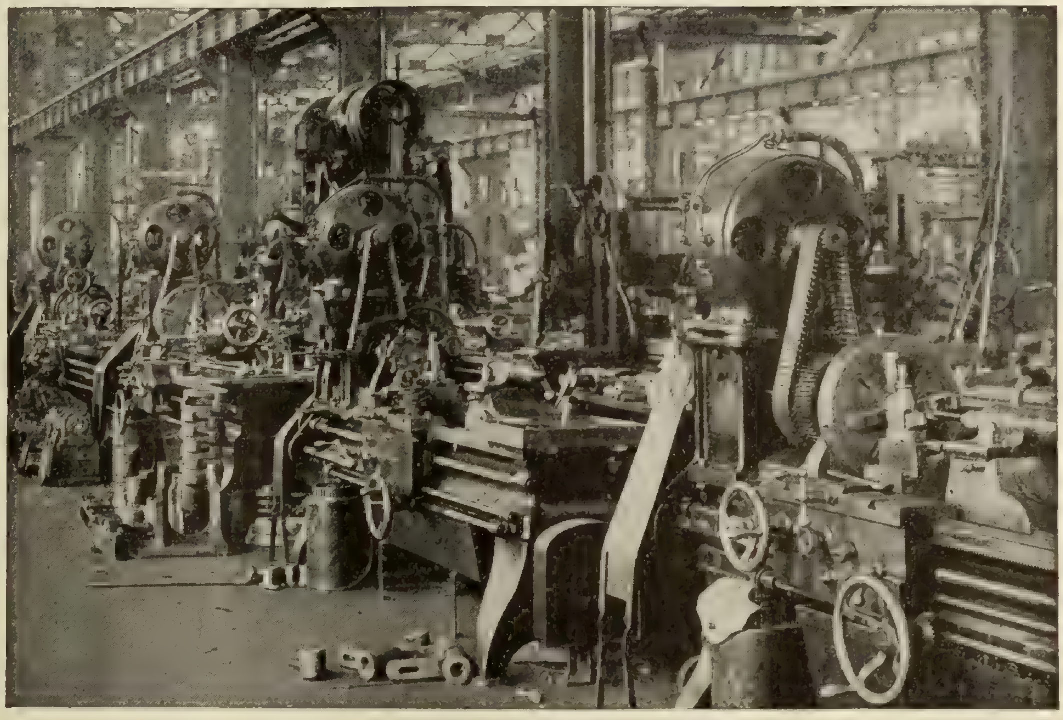
This form is constructed for the lifting of loads up to 600 lbs. very quickly.

By overhauling 10 ft. of hand chain we get a load lift of 1 ft., a hoisting speed never before attained in a portable hoist.

A dandy for light foundry work.

May be used for lifting heavy castings to the grinding wheel, for loading castings, barrels, boxes, etc., in warehouses and shipping rooms.

Wright Manufacturing Company
LISBON, OHIO, U. S. A.



This illustration shows a battery of small lathes in a railroad machine shop, each driven by a 3-h.p. Morse Silent Chain 2¼″ wide by ⅝″ pitch. These were old machines, redesigned in 1903 for individual motor and Morse Silent Chain Drive.

Ten Years Per Drive

The ten chain drives shown, together with eight others in the same shop, have now been in service since 1903, and are still in good condition and capable of much further use. A total of thirty-one (31)

MORSE Chain Drives

were installed in this shop at that time on old redesigned tools, and to date show an average life of 8½ years per drive.

The evidence in favor of MORSE Silent Chain Drives for YOUR machines is now complete, to wit:

Efficiency—99%, sustained at all times, regardless of conditions of service.

Durability—Each drive should last at least three years (the average is shown to be much higher), or long enough to pay for itself by the saving of power.

Reliability—Installed right, they need never come off the sprockets. They don't part or break as do belts. Require very little lubrication and practically no attention.

Economy—Any drive that will pay for itself before worn out is an economical proposition regardless of first cost.

Everything considered, MORSE Silent Chain Drives will prove best for YOUR machines, more efficient, more durable, more reliable and more economical. You can't afford longer to be without them. Write us for full particulars to-day.

NORTON

TOOL GRINDING WITH NORTON WHEELS

Alundum Wheels are widely recognized as the unexcelled grinding wheels for sharpening steel tools—a reputation that increases with each passing year.

WHAT OTHERS SAY—

"A very cool, free-cutting wheel; works well dry without burning"—on small high-speed steel tools.

"Hold their shape and cut the steel either red hot or cold"—in the manufacture of air-hardening steel tools.

We make Alundum Grinding Wheels of regular or special temper to meet every tool sharpening requirement. Let us prove it to you.

A Grind that makes men happy

It makes the **boy** happy because he doesn't have to **worry** about the drill being **ground right**—he **knows** it is, for the machine he is working on is **automatic.**
He is using an

American Drill Grinder

It makes the drill hand happy to see the **big chips** roll out when the drill is at work, and because it **cuts a long time without being reground.**
It makes the **owner** happy to hear the drilling machine doing its work **easily, but very efficiently.**
There is more behind a properly sharpened drill than you'd imagine at first thought.
Our book "DRILL GRINDING MACHINES" tells why. There is a copy waiting for you. Where shall we send yours?

The Heald Machine Company
10 New Bond Street Worcester, Mass.

FORD-SMITH GRINDERS

20" SPECIAL

The heavy overhung bearings on this type have proved of great value to many of our customers on various lines of work. We build a large number of "specials" besides our full line of Floor and Water Tool Grinders, both belt and motor driven.

Let us quote on your present and future grinder enquiries.

Stock Deliveries

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our warehouse in all current sizes, flat, squares and rounds; annealed and unannealed.

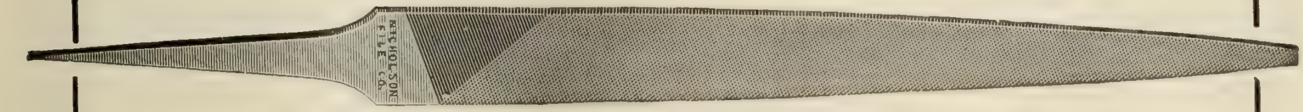
To Get a Filing Department of Maximum Efficiency

NO matter whether shop, piece-work, fitting or assembling department, it pays to have sharp files in constant use.

It pays to give an 18, 20 or 25-cent file only a set and definite length of service, especially in the hands of your highest price labor.



NICHOLSON FILE CO.

By using a file only (say) 6 hours, and then discarding it, you conserve the skill and effort of your workman to finishing pieces, and do not fritter it uselessly away in pressure with a dull file, fatigue, skimped work, and errors.

"Nicholson-made" Files have teeth of exceeding sharpness, made glass-hard by a private process. The steel is of special formula. Each file is hand tested. As far as humanly possible, "Nicholson-made" Files are unvarying in "feel" and cutting power.

Study the economics of your shop where filing is done. Use "Nicholson-made" files, to enable full filing efficiency to be reached.

All Jobbers.

For Your Big Jobs

you need a micrometer which will give you as accurate results as the ordinary micrometer does on small work. You need a micrometer which will quickly give any size between one and six inches without turning the handle through the whole distance. You need a micrometer that you can rely on. The tool that fills these needs is the

Starrett Government Micrometer

It was made to suit the requirements of the Ordnance Department of the United States Government and many of them are now doing service there.

The micrometer frame is cut from steel plate and is covered with hard rubber to prevent expansion from the warmth of handling. The micrometer adjusts one inch reading 1-1000 of an inch. Tail Spindles forming anvils are provided and these may be quickly adjusted to the micrometer, making it possible to measure anything between one and six inches without turning the spindle more than one inch. This is the ideal micrometer for general tool room service.

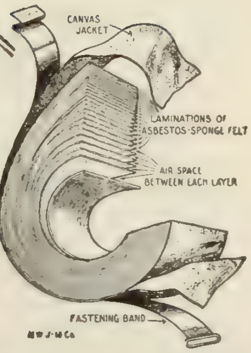
Astonishing Reductions in Fuel Bills

effected by ordinary pipe coverings when placed on bare pipes are not as remarkable as the reductions J-M Asbesto-Sponge Felted Pipe Covering makes in fuel bills when placed on pipes previously insulated with ordinary covering. Repeated tests prove that J-M Asbesto-Sponge Felted Pipe Covering will save about 26% more coal than any ordinary covering. It will carry steam over a mile with practically no loss. The secret lies in the fact that



CANVAS JACKET
LAMINATIONS OF ASBESTOS-SPONGE FELT
AIR SPACE BETWEEN EACH LAYER
FASTENING BAND
H W J-M Co

J-M Asbesto-Sponge Felted

Pipe Covering

contains more dead air cells than any other covering

Vibration or rough usage will not crack, break or cause J-M Asbesto-Sponge Felted Pipe Covering to crumble or lose its insulating value. It retains its high efficiency indefinitely, because made from many layers of a thin felt composed of best quality Asbestos Fibre and fine particles of granulated sponge.

To use J-M Asbesto-Sponge Felted is an investment, not an expense.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

Sand Rammer in operation.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

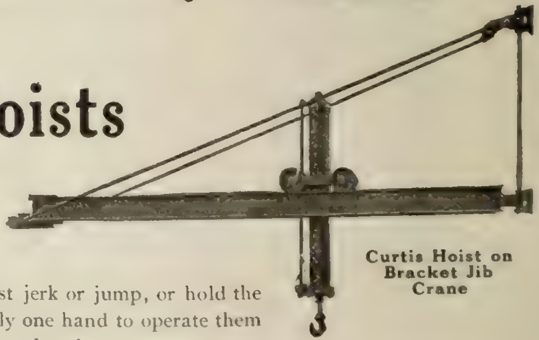
Curtis Foundry Hoists



Curtis Hoist on Bracket Jib Crane

Whether on crane, elevator, or overhead trolley system, will handle the most delicate foundry hoisting in just the way you would want it handled—fast or slow, start or stop as gently as you please and without the slightest jerk or jump, or hold the load at any point of the lift. They require only one hand to operate them and cannot drop the load even should the air hose break.

WE WILL EXHIBIT OUR FULL LINE OF FOUNDRY EQUIPMENT IN

BOOTH 302

FOUNDRY CONVENTION EXHIBITION, CHICAGO, OCTOBER 10th to 17th.

Meet us there.

No User of Ball Bearings Can Afford to Neglect These Points

1 **Double Row of Balls**—virtually two bearings in one—a splendid feature under any load condition.

2 **Pressed Retainer in One Piece**—made from Swedish Lancashire Iron. No rivets, wires or screws to work loose, jam balls, disarrange spacing or make noise.

3 **Outer Race Spherical**—providing for a frictionless self-alignment that absolutely and automatically compensates for shaft spring.

4 **Best Swedish Crucible Steel**—Carefully heat-treated and uniform in hardness throughout. Unequalled for toughness, carrying capacity, accuracy and durability.

SKEFKO

is the only truly self-aligning bearing. This feature alone is worth most careful consideration.

SKEFKO Self-Aligning Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more and are made in international standard sizes. Their use is practical under any speed and load condition and the lubrication and protective housing can be made to conform to any service requirements.

SKEFKO are the recognized standard and are replacing other constructions in many types of machinery.

Our literature explains these matters in detail. Your best interests demand that you investigate. Tell us your bearing troubles and ask for our bulletins.

IT'S THE DESIGN, WORKMANSHIP AND MATERIAL of the hoist that make it efficient.

Efficiency is the proportion between the energy applied and the energy derived.

A leaky valve or poor packing will allow a good part of the energy (compressed air) applied to the hoist to escape, thereby reducing the energy derived (lifting capacity) proportionately.

INGERSOLL-RAND AIR HOISTS

have valves of the direct lift disc seated type, which allow no leaking.

The valve seats are of brass as are the stems, the valves being faced with rubber, making an absolutely air-tight joint.

They keep this state of perfection for an extended period owing to their positive non-rubbing action.

The piston and rod are packed with an improved form of cup leather packing which adjusts itself automatically to suit the air pressure.

With INGERSOLL-RAND workmanship in them you can rely on these Hoists for the highest efficiency.

HACKSAWS

Every user is looking for a blade best and particularly adapted for their purposes.

"STERLING"

Blades are made to fill every requirement that may be asked of a hacksaw blade. They're first-class in every respect and economical.

What are your requirements?

Do you use or are you in need of a Power Hack Saw Machine? If so, get a "STERLING." It's good.

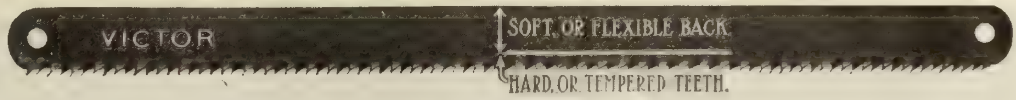
HIGH SPEED
POWER SAW

Manufactured by

DIAMOND SAW & STAMPING WORKS

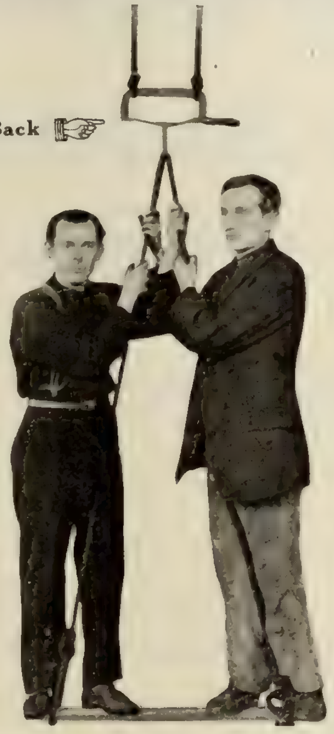
BUFFALO, N.Y., U.S.A.



VICTOR FLEXIBLE HACK SAWS

WHY isn't a machine made to *re-cut* worn out hack saws?

BECAUSE 75% of all all-hard hand blades break before they are worn out.



Watch the enormous blade-breakage in your own shop. Then use Victor Flexibles that never break in the average workman's hands and note the economy.

DON'T confound **Victor Flexible Hack Saws** with old-time flexibles or the clock-spring steel blades which have given Flexibles such a bad name. They are as inferior to a Victor Flexible as a cheap file is to an A-1 Swiss.

Victor Flexibles are made only from high-grade semi-high speed steel. They have the supremely tough, sharp, milled teeth of the finest all-hard blade combined with a flexible back of triple strength.

For this reason **Victor** Flexibles cut exactly the same materials as the best all-hard—do it quicker—and last infinitely longer because they **cannot be broken in a hand frame except by intentional misuse.**

Victor Flexibles have been proved by shop tests to be **twelve times less breakable** than "all-hards." This makes the **Victor** Flexible the

Most Economical Hack Saw Blade Ever Manufactured

Because of their supreme toughness **Victor** Flexible cannot be equalled for work in awkward positions which ordinarily causes a high rate of breakage or in the hands of inexperienced workmen.

We make **Victor** Flexible Blades in every style of blades suitable for hand frames. This means the blades best adapted for your particular work can be secured.

MAGNOLIA ANTIFRICTION METAL

A Perilous Situation In The Bay Of Biscay

Crew, Ship and Cargo Saved By Magnolia Metal

944 E. 180th St.,
New York, N.Y., June 8th, '912.

Gentlemen:—

I am only too pleased to give my experience with Magnolia Metal for it may help another Engineer out of a tight place.

A steamer in a gale in the Bay of Biscay on a lee shore about 7 miles distant, which meant if we had stopped we would have been on the rocks in an hour. The high pressure crank pin of the 2,000 h.p. triple expansion engine got hot from the heavy racing of the engines due to the violent pitching of the vessel. All the bearings of these engines were Magnolia lined. With this crank pin we put on the hose and used liberally graphite and machine oil and the bearing was cool in an hour and we ran for 96 hours full speed before we took it down and then just a slight film of the metal had wiped off which relieved the bearing and permitted us to run without the engine pounding too heavy.

My experience has been with other metals once they got hot—all or nearly all the metal runs out and some of the metal runs into the oil pipe and stops the lubricant from reaching the bearing and the engine must be stopped. The bearing dressed and adjusted on the engine will pound itself to pieces so you see in the instance I have mentioned Magnolia deserves all the praise anyone can give it. Since that time I have had Magnolia act the same on stationary engines and about nine months ago on a 2 15-16 shafting hanger and after the day's run was over took the box and cleared away the metal which had wiped off and put box back into service again.

Respectfully,

HAROLD JAMES

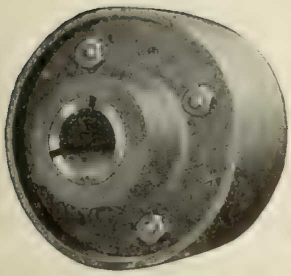
SHAFTING COUPLINGS

Solid Sleeve

DODGE SOLID SLEEVE

A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.



Single Compression

DODGE KEYLESS COMPRESSION

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.

Buffalo Automatic Engine driving Steel Plate Fan for Mechanical Draft.

"Buffalo" Fan System of Mechanical Draft

The most scientific and up-to-date method of increasing boiler plant efficiency

Gives every boiler plant the widest possible range of capacity, with flexible, positive and instantaneous control. Every sudden demand for steam is easily and promptly met. Combustion is maintained at highest efficiency, while low grade fuel can be used to great advantage.

The automatic engines used with the fans are especially adapted to service requiring a high degree of efficiency and reliability with a minimum of attention.

Installations of this system are to-day in successful use in gas, electric and power plants, schools, colleges, public buildings, hotels, and industrial plants of all kinds.

Their ready adaptability to every condition makes their use standard in the modern boiler plants.

Let us know your requirements and we will quote on an equipment. The nearest house, Dept. N, will answer your letter.

"The Borderland"

¶ A few years ago it occurred to a few thinking men and women that the thing we know least about is the culture and development of the mind. Tree planting, fruit raising and the study of the stars have been given serious study since Aryabhata sent from his observatory on the Banks of the Ganges the truth that the earth is but "a grain of sand on the infinite shore of the universe."

¶ Luther Burbank, in his home and gardens in California, has recently discovered some wonderful secrets about changing common weeds into beautiful flowers, about growing highly flavored and delicious fruit on the sand cactus, about developing poisonous vegetable parasites into daisies, roses or lilies—depending on the nature of the weed.

¶ A few years ago we knew nothing about electricity. The lightning's flash was as great a mystery to us only a century or so ago as it was to the savage warrior who wandered across the plains in the first dim light of the intellect of man. To-day electricity is lighting cities, driving trains at ninety miles an hour, pumping water, turning machinery, and sending the world on toward greater things at a speed unguessed and undreamed even by the prophets and soothsayers of yesterday.

¶ But it does not require a "crystal gazer" to see approaching discoveries in the study of a peculiar and mysterious form of energy. **We call this form of energy the mind, or the power of thought**—and what is the secret of Burbank's discoveries, Edison's inventions, the secret of the telephone, the secret of the reaper, the dynamo, the secret of the electrically driven car. but a form of energy that existed first as the power of thought?

¶ We have learned in the last few years that a criminal is a man whose memory, imagination and ideals were arrested at an early period of life; a man who ceased to grow, a man whose mind for some reason went into bankruptcy. We have learned recently from Binet, a French philosopher and scientist, that the minds of many men at forty are developed but little more than that of the child.

¶ If we have learned that the arrested development of the mind produces the criminal, and that the super-development of a certain part of the brain has produced the street car, electric light and the dynamo—then it occurs to us naturally that there is a great secret—an all-pervading law—which we are about to discover—the secret of developing the mind of man. This idea or this universal truth is knocking at the door of our intelligence on every hand; at almost every hour some glimpse of what is going on behind the shifting scene, comes to us like lightning's flash out of the midnight storm.

¶ We are developing the well rounded man—a product the world has never seen until the present century. The world has been filled with freaks— men who knew music and nothing else; men who could write poetry and could not make a living; men who composed for the harp and the zither—who wore long hair, lived the lives of vagabonds and died in poverty. But the well rounded man, the man of dignity, the man of poise, the man who discovers a secret passage—a new door to a new realm of thought almost every day—is distinctly a product of a new age.

¶ The next fifty years will be a trip into the infinite, into the unexplored—into the unknown. We are learning how to raise children—how to develop them mentally and physically; we are learning how to grow plants and flowers, and we are learning to think swifter and surer.

¶ The mind is a form of energy. Energy is everywhere in the universe. It is a thing that underlies all substance—is behind all substance—and the most powerful form of energy known to this or any other planet, is mind. The time is not far when we will know the secret of developing the mind.

¶ Just as the secret of electricity was stolen from the sky with a key, just as Burbank found a golden thread of natural law leading from the weed to a flower, just as Marconi discovered that a strata of air would carry an electrically-driven message from a lightouse off the coast of Newfoundland to the Tower of Pisa—so will we one day find the secret through which we can scientifically and systematically develop the mind of man with the same degree of accuracy, certainty and precision with which we are now directing these other forms of universal energy.

Efficiency

CHARLES BLAIR GORDON

THE new president of the Canadian Manufacturers' Association, Mr. Charles Blair Gordon, of Montreal, is one of the most tireless and enterprising men in Canada. He is a millionaire through his own efforts, but he works as hard today as when he was struggling to lay the foundation of his vast fortune. At business or play, he moves swiftly. In office hours, he directs the affairs of the Dominion Textile Company, the great cotton company of Canada, which employs thousands, and has established mills all through Eastern Canada. When work is over, Mr. Gordon gets into his swift motor boat, which moves like himself, straight through its environment to the goal.

CHARLES BLAIR GORDON

When Charles Gordon finished his high school course in Montreal he took a position in the wholesale dry goods firm of McIntyre, Sons & Company. He learned the rudiments thoroughly, and then started in his business career by organizing the Standard Shirt Company. Before long he secured control of other concerns and merged all his holdings into the Canadian Converters Company.

Mr. Gordon is an example of the success which comes to the able man who devotes all his brain and energy to one restricted field. He specialized in cotton, and he knows the cotton industry from beginning to end, and a great deal about the allied textile industries. He specializes also on the problem of management, which so vitally concerns industrial problems. Efficiency is the mainspring of his company, as it has been his own.

Mr. Gordon has served his apprenticeship in the work of the C.M.A., and lays down the office of vice-president to take up that of president.

In addition to acting as president and managing director of the Dominion Textile Company, Mr. Gordon holds the following industrial positions: director of the Montreal Cotton Company, vice-president of Penman's Limited, president of the Hillcrest Collieries, director of Molson's Bank, director of C. Meredith, Limited, and director of the Travelers' Life Assurance Company.

The Canadian Manufacturers' Association Convention

Of the many Conventions held throughout the year in the more or less important towns and cities of our Dominion, and of the almost numberless topics discussed relative to some form or other of our individual, domestic, social, political and religious well-being, none, we venture to suggest, bear with the same intensity of directness on what is, after all, the mainspring of our national existence—to wit, our commercial standing and ascendency—as does the Annual C.M.A. Convention, its deliberations and decisions.

HALIFAX welcomed with open arms the one hundred and seventy-four members of the Canadian Manufacturers Association, representative of the industries of the Dominion, who had arrived in the city earlier in the day for their Annual Meetings. The Nova Scotia branch of the C. M. A. received the visitors at the station and conveyed them in automobiles to their hotels and temporary homes.

This is the second occasion on which the C. M. A. has met in Canada's eastern gateway and the enterprising folks of the city certainly made a lasting impression on the visitors from all other industrial centres of the Dominion.

The opening session of the convention in the Technical College at 8 p.m. was purely formal. The handsome home of Nova Scotia's technical educational system was ablaze with electric welcomes, and on its walls were many banners and pictures descriptive of the Province's industrial resources. The welcome of the Province was tendered by Premier Murray, who spoke of the importance of the manufacturing industry. He wished the Manufacturers' Association success, and naively hoped that they would be moderate in their demands. Mayor Bligh voiced the city's welcome. F. B. McCurdy, M.P., President of the Halifax Board of Trade, spoke for that body, and told of Halifax's early prominence in banking and the foundation of its wealth in the old days.

A Note of Criticism.

Thomas Cantley, General Manager of the Nova Scotia Steel Co., who welcomed the C. M. A. as its Vice-President for Nova Scotia, strongly criticized the management of the I. C. R. for increasing freight rates, contrasting the burden placed on the Maritime Provinces thereby with the free canals in Ontario. He also took a strong stand on the tariff, pointing out that the situation so far as the steel makers were concerned was becoming intolerable, and took a rap at his fellow-manufacturers by pointing out that they were importing much of their steel free and getting a duty on the finished product.

President Gourlay responded on behalf of the Canadian Manufacturers' Association, declaring that it stood no less for manufacturing and industrial development of the country than for the spiritual development of the country.

BARRINGTON STREET, HALIFAX, NOVA SCOTIA.

President's Address.

The Manufacturers' Association got down to business on the morning of September 17, when R. S. Gourlay delivered the presidential address before 200 delegates. In it, he made the declaration that the C. M. A., while satisfied with the present general level of the tariff, nevertheless contended that revision was necessary at least in regard to the wool, iron and steel schedules.

"It should be made clear and emphatic," he said, "that we are unalterably opposed to any general lowering of the tariff on goods of a class or kind made or produced in Canada." No reference was made to British preference, but Mr. Gourlay contended that the U. S. tariff revision had vindicated the judgment of those Canadians who had opposed the reciprocity treaty. Despite the financial stringency, the president took a hopeful view of the situation, and praised the conduct of the banks. A noble ambition converted into a football of party politics, was his comment on the naval proposals.

Industrial Parliament.

Mr. Gourlay spoke of the annual meeting as being in reality "a parliament of industry," and while the decisions might lack the force of legislative enactments, "their influence for good and evil may be greater and more far-reaching than you know." He hoped they would approach the business before them with broad minds and open hearts, remembering that their first duty was to Canada, and that they must be prepared at all times to subordinate individual advantage to the common good.

The past year had been filled with happenings of great moment, both at home and abroad. "Here in Canada," he said, "it has divided our two great political parties on an issue that should have united, rather than separated them, while the check it has placed on over-speculation and the lessons of business caution taught us have been both timely and salutary."

Money Stringency.

Discussing the money stringency, Mr. Gourlay said the Balkan war and German war tax had led to the hoarding of gold, but these, and like causes, did not satisfactorily explain the Canadian situation, the key to which he believed was in the fact that Canada is financing her rapid numerical growth and development on borrowed capital.

R. S. GOURLAY,
Ex-President, Canadian Manufacturers' Association.

"The wealth of our resources is unquestioned, but that wealth has not yet been converted into money, or into merchantable commodities that can be used to pay our debts," he said, "Meanwhile our immediate requirements in goods from other nations are far in excess of anything we have to offer in return. For the twelve months ending May our imports for consumption were $685,000,000; our exports of domestic produce only $358,000,000. If we go back for ten years the total adverse balance amounts to $1,051,000,000. This we have had to pay in cash, and we have had to borrow it.

Flooded the Market.

"In the effort to secure capital, we have thrown industrial bonds by the millions, municipal debentures by the tens of millions, and railway securities by the hundreds of millions on to the markets of London, Paris and Berlin. In the natural course of events, it could only be a matter of time till our credit abroad would approach its limit, and this past year the inevitable happened, supplies were in part shut off, carrying charges had still to be met and the result was tight money."

Praise for the Banks.

To say that the banks had refused to provide money for speculative ventures, or for the financing of new enterprises, was to acknowledge that they had chosen rather to reserve their resources, so as to be the better able to take care of legitimate business.

"The money that is loaned by our banks on call outside of Canada is another favorite ground of attack by people who speak with a very imperfect knowledge of the situation," he proceeded. "A bank's call loans are as much a part of its reserve as the gold that lies idle in its vaults, in addition to which they afford an easy means of liquidating, temporarily at least, a substantial portion of our foreign trade indebtedness. It is worthy of note that the amount of money loaned by our banks on call outside of Canada was $28,000,000 less in July of this year than in 1912.

Financing the crop.

"From now till the first of January, our banks will require to provide in the aggregate a sum sufficient to purchase a grain crop in the west valued at $200,000,000. It speaks volumes for the banking system of Canada that so large a sum will be provided for so useful, so necessary a purpose, with so little disruption to other business."

Generally speaking, business had been good, but there had been a noticeable falling off in building permits, especially in the west, affecting some trades. Over-speculation, too, in real estate had been followed by depression. He, however, was not anxious. "Under Providence, nothing can stop the progress of this wonderful country."

PLANT OF DOMINION IRON AND

Tariff Policy.

The general revisions of our Canadian tariff synchronized fairly closely with the general revisions of the United States tariff, which was juggled; one set of items would be carried under a high duty one year and low the next, while another set would be raised from a revenue basis to a prohibitive basis.

"For the resultant unsettling of business, which inevitably followed, we find no counterpart in Canada," said the president. "In expressing the hope that this may long continue to be our policy, I do not wish to be understood as of the opinion that the Canadian tariff is not in need of change. Our tariff in the main has been a beneficial one, but it is by no means perfect.

Suggestion for Revision.

"The woollen schedule is not what it should be, otherwise an industry that should be indigenous to an agricultural country like Canada would not have languished as it has. Neither is the iron and steel schedule satisfactory. As at present constituted it is to some extent encouraging the establishment and expansion of what might be called 'secondary industries,' but it is far from adequate in the protection it affords to certain of the more basic branches of the iron and steel trade, where the investment in plant must necessarily be heavy, and where volume of output counts for so much. I cite only these two cases to support my contention that the tariff needs revision and needs it badly.

General Level Satisfies.

"We do not ask nor do we want higher duties all along the line. I am aware that such desires are attributed to us, and will probably continue to be, despite anything we may profess to the contrary. If it will serve any useful purpose, let me here and now, place our association on record once more as being satisfied with the present general level of our tariff, subject to the adjustment of certain defects, such as those I have mentioned.

Demand for Protection.

It should be made clear and emphatic that we are unalterably opposed to any general lowering of the tariff on goods of a class or kind made or produced in Canada. We will stand firmly by the principle we enunciated in this city eleven years ago, namely, that our tariff should be so framed and consistently maintained as to transfer to the workshops of our Dominion the manufacture of many of the goods we now import from other countries."

U. S. Revision.

Mr. Gourlay asserted that the U. S. tariff revision confirmed him in the belief that Canada made no mistake in rejecting the reciprocity agreement of 1911. "In saying this I do not question the value of the market concessions we would have secured thereunder, but whereas then we would have secured these concessions only in return for similar concession on our part, now we are to secure many and some of the most substantial of them without an embarrassing consideration of any kind," he said.

J. H. PLUMMER,
President, Dominion Steel Corporation.

"Cattle, swine, pulp, paper worth up to 2½c a pound, dressed lumber, staves and coke will all enter the U. S. duty free and subject to favorable interpretation fish, coal and wheat will also be free; even under the most unfavorable interpretation of which the foodstuff schedule is capable, wheat will be subject to a duty of ten cents only, as against 25 cents at present, while on fruits there will be material reductions. tions.

Judgment Vindicated.

"The judgment of those who opposed reciprocity on the ground that sooner or later we would have the wider market as a result of United States tariff conditions is thus vindicated; on the other hand, I am sure that the prospect of an early enjoyment of these privileges will assuage the disappointment of those who gave reciprocity their support.

"There are many lines of common manufacture on which the United States duties are still higher than our general tariff, and even more disproportionate in relation to our preferential tariff. The most that can be said of her new average rate of duty is that it will now approximate Canada's."

Continued immigration and the retrenchment due to money stringency had temporarily solved the later situation, the newcomers including 72,243 mechanics, but skilled labor is always in demand.

Imperial Defence.

Touching on the question of Imperial defence, President Gourlay referred to the joint resolution passed by the House of Commons in 1909, and said:

"Having thus placed ourselves on record four years ago, we are to-day in the humiliating position of a nation that has pledged itself to a course of action and done nothing, or next to nothing. If the need for action was recognized as imperative in 1909, it is surely far more so to-day. With so impelling a duty before us we have been chagrined and humiliated by the spectacle of a noble ambition converted into a football of party politics.

Shipbuilding in Canada.

"The feasibility of building in Canada all or any of the vessels that shall constitute our contribution to the defence of the Empire is a matter which should be left for experts to decide. That we could build them goes without

STEEL CO., LTD., SYDNEY, NOVA SCOTIA.

saying, were the question of cost to be left out of consideration. Certain it is, too, that we will never have in Canada naval shipyards worthy of the name unless we some time make a beginning, and I am sure I am right in crediting you all with a desire to see our country possessed of such equipment at the earliest practicable date.

Humble Beginning.

"I am constrained to believe that Canada would be wise to content herself with the building of smaller vessels and other work incident thereto as a commencement, leaving to the naval yards of England for the time being the task of providing the ships that shall proclaim us a nation. What we would all like to see, what we believe will eventually come, is the revival of shipbuilding on a large scale at our ocean ports.

The speaker believed that the broad policies in relation to transportation, fire prevention, workmens' compensation and other matters have heightened the esteem in which the association is held throughout the Dominion.

C.M.A. Work and Progress Record of Past Year

The Officers' and Committees' Reports submitted to the Convention give unmistakable indication of activity, accomplishment on behalf of and abiding confidence in the future of our country reaching one day the front rank of the World's Commercial Nations.

STANDING COMMITTEES' REPORTS.

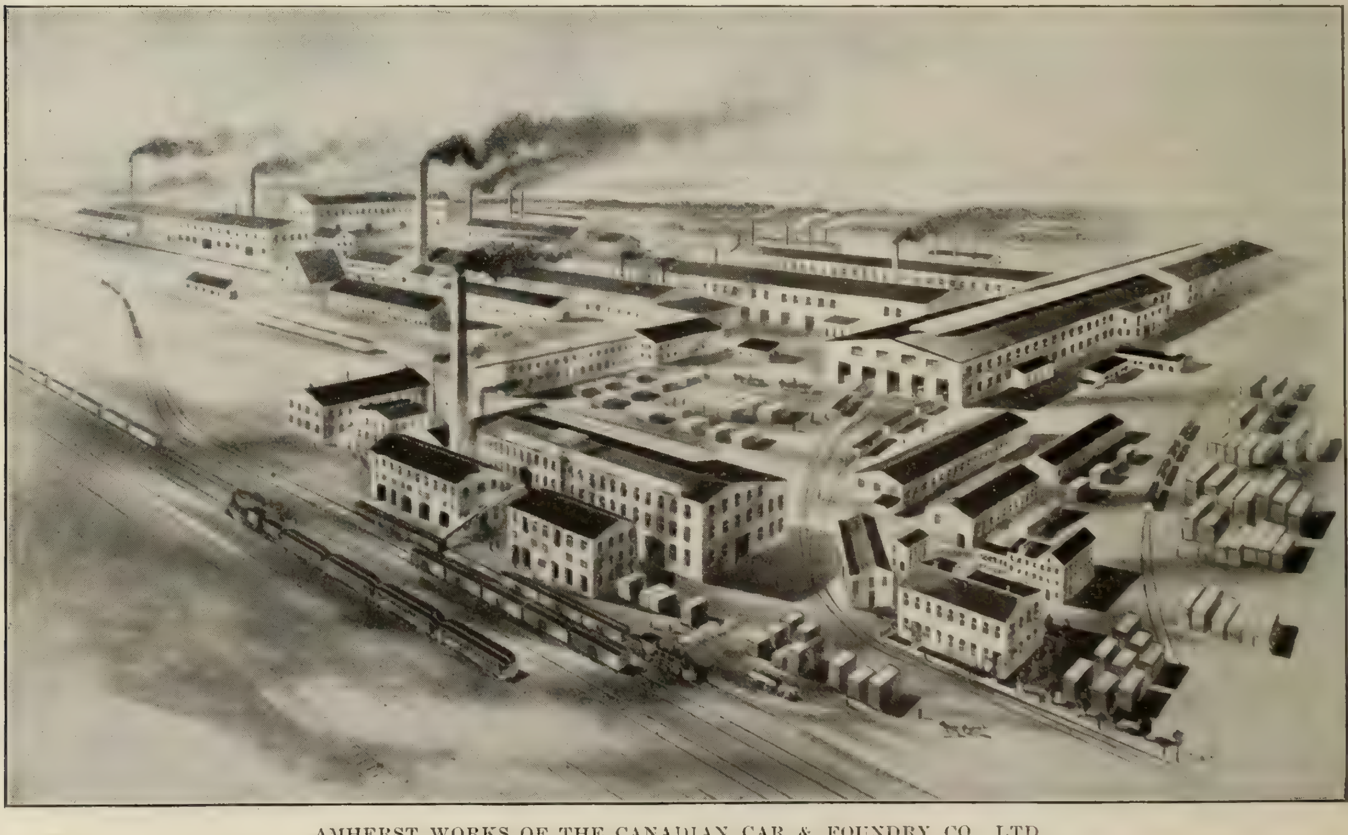
THE Assembly Hall of the Halifax Technical College building was packed to capacity with several hundreds of the leading manufacturers of Canada on Wednesday afternoon, September 17, to hear Reports of the Standing Committees as submitted for the consideration of the Annual Meeting. Considerable interest was evinced owing to the variety of vital subjects to be discussed. These included technical education, workmen's compensation, several important legal questions, as well as several radical changes in by-laws suggested by the general secretary governing the admission of new members.

Secretary's Report.

The most important statements made by Mr. G. M. Murray, the general secretary, were under the heading of new by-laws. His first suggestion was that the fiscal year, which up to the present has ended on July 31, be changed to April 30, and that the Convention be held in June. His chief reasons for suggesting this were, firstly, the difficulty of holding committee meetings in August on account of holidays, and the difficulty the members of the staff had in getting away for their vacations during the summer months. Mr. Murray referred also to the provision of an Executive Committee from among the members of the Executive Council, so as to centralize in one body the business management of the Association's affairs, instead of dividing the responsibility over four different committees. Such a committee, he said, would relieve the Council of much of its routine work, and he believed it would simplify and expedite their accountancy work.

Reception and Membership Committee Report.

The chairman of this committee was Mr. C. B. Lowndes. Satisfactory progress in membership returns was reported, and it was pointed out that there were sufficient eligible and desirable manufacturers outside the fold to allow of a further increase. The committee, however, deemed it prudent for the future to be satisfied with moderate gains. Referring to the by-law revision, the committee believed that in stipulating that an applicant for membership must at least employ five hands in his mechanical department, the association was taking a desirable step in the direction of more precisely defining what should constitute eligibility for membership. Beyond that point, no attempt would be



AMHERST WORKS OF THE CANADIAN CAR & FOUNDRY CO., LTD.

made to define what is a manufacturing business and what is not.

Insurance Committee Report.

The chairman was Mr. H. W. Fleury, and the vice-chairman, Mr. C. C. L. Wilson. Attention was again drawn to the necessity of a fire marshal, and the hope expressed that the promised legislation in Ontario for the creation of such an official would be given practical effect at the next session of the Legislature.

The financial condition of the country had not been favorable to the expenditure of large sums of money for protective fire appliances, yet plans had been made by the Associations' engineers for 39 sprinkler equipments, as against 42 in the preceding year, 20 of which had been completed.

Parliamentary Committee Report.

Chairman, Mr. Thomas Findley. The most important subject dealt with by this committee was that of the jurisdiction between the Provinces and the Dominion in respect to Company Incorporation and Registration. What the committee had to say upon this subject is given in full below:

"The stated case referred to the Supreme Court by the Dominion Government covering the disputed questions of jurisdiction between the provinces and the Dominion in respect to this subject was heard in February, the Association being represented by Mr. F. H. Chrysler, K.C., and Mr. Wegenast. The case of the John Deere Plow Co. v. Agnew, one of the test cases, by supporting which the Association had designed to insure a determination of the issues in which the members were most vitally interested, was heard at the same time.

"In this latter case, the plaintiff, the John Deere Plow Co., had been operating under a Dominion charter, with head office at Winnipeg, and carrying on a general business in agricultural implements throughout the Western Provinces. The Company had applied for a license in the Province of British Columbia, but was refused because another company of a similar name, incorporated by one of the American States, had previously become registered in the province. The position was, therefore, that by the operation of the Provincial law a Company duly authorized by the Dominion Government to carry on trade throughout Canada was finally and absolutely excluded from the Province of British Columbia.

"The position which had been taken on behalf of the Association was that a Dominion charter should entitle a Company to carry on business throughout the whole of Canada without the necessity of licensing or registration, practically amounting to re-incorporation, in each of the provinces. The Company sued upon a claim against a merchant in British Columbia who had refused to pay, pleading the incapacity of the Company, by reason of the Provincial Act, to take any proceedings against him. The Provincial Court upheld this contention, and the validity of the Provincial Act which rendered the Company impotent to bring the action.

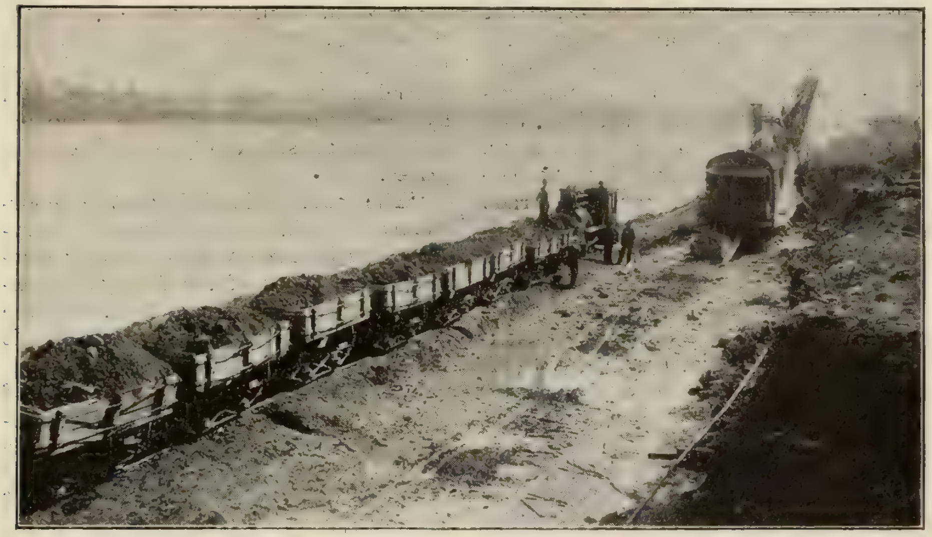
"The Supreme Court of Canada, on appeal, held that the transaction out of which the claim had arisen did not show that the Company had been actually carrying on business in the province, so that it was not necessary to decide the constitutionality of the Provincial Act. As a matter of fact, the defendant had acted as the representative of the Company under an ordinary form of exclusive territory contract. The goods supplied to him were to remain the property of the Company until paid for; the defendant was to take lien notes in favor of the Company; the proceeds of the goods, if paid to the defendant, were to be held in trust for the company; the defendant was to keep the goods insured by a policy in the name of the Company, and was to sell the goods at certain prices.

"The court having held that these circumstances did not constitute a carrying on of business within the very comprehensive terms of the Act, your committee deemed it wise not to disturb the decision by encouraging an appeal. It was found, however, that the same Company had in contemplation a number of other actions, by means of which to secure a determination of its status in the Province of British Columbia. One of these was a friendly action by one of the shareholders of the Company to restrain the Company by an injunction from carrying on business in the Province. The other was a claim against a customer in the Province in which the circumstances showed clearly a carrying on of business through a duly authorized representative. Both these actions have been brought and decided by the trial judge against the Company.

"At the suggestion of your committee an application was made by the Company for leave to appeal direct from the

YARMOUTH, NOVA SCOTIA, AND ITS SHIPPING.

judgment of the trial judge to His Majesty's Privy Council, and this application has been allowed with a direction that the Attorneys-General of the Dominion and the four Western Provinces should be served with the order allowing the application, and should be given leave to intervene. The cases should come on for hearing in the ordinary course in November, but it is possible that upon application of one or more of the Provinces, the hearing may be postponed until February.



WORK TRAIN, ST. JOHN VALLEY RAILWAY, FREDERICTON, N.B.

''Your committee are advised that the cases are regarded by the Privy Council as perhaps the most important constitutional cases that have come before that body from Canada. It is confidently expected that the result of the hearing will be the determination of the long outstanding issue between the Provinces and the Dominion which has been a source of great difficulty to all companies engaged in manufacturing and commerce. Meanwhile the judgment of the Supreme Court upon the stated case above mentioned has not, up to the date of the writing of this report, been handed down. It is quite possible that the decision in this case when issued may afford a satisfactory solution, subject, of course, to an appeal to the Privy Council. Your committee propose to continue their endeavors to protect the interests of members by giving the closest attention to these issues. The subject is as complicated as it is important, and the committee bespeak the continued support and confidence of the Association in dealing with it.

''In the meantime, the Legal Department is uniformly advising companies, whether operating under Dominion or Provincial charters, to refrain from registering in any Province, unless there are special circumstances demanding immediate action. In particular, it is unwise for Provincial Companies to take out licenses on the basis of their Provincial Charters. The course suggested, where action is necessary on the part of a Provincial Company, is to take out a Dominion Charter and to defer, as far as possible, the obtaining of Provincial licenses until the cases now before the courts are finally decided.

''The Department is in a particularly advantageous position to advise members in all matters of Company organization and administration, and to undertake any work connected therewith. It is part of the regular work of the Department to procure charters for Companies newly organized or reorganizing, and to take out licenses where it is deemed necessary. A considerable amount of this work has been done during the past year, and members are invited to make full use of the facilities of the Department for the coming year, either directly or through their own solicitors. It may be added that, in a large number of cases which regularly come before the Department, it is found that considerable inconvenience and expense could have been saved by earlier consultation.''

PLANT OF THE CANADIAN COTTON CO., LTD., FREDERICTON, N.B.

The committee reported having approved of the general principle of a bankruptcy measure. Owing to the fact that the Winnipeg branch of the Association had opposed the principle, the committee asked that the Convention give some further direction in this matter, so that they (the committee) might be guided during the coming year. It was also suggested that further discussion of a resolution of the Montreal Branch favoring the establishment of a system of commercial courts to deal with claims and disputes in connection with commercial transactions be deferred pending the outcome of the agitation in favor of a bankruptcy system.

The committee renewed their protest against the unjust discrimination of the immigration regulations of the Dominion Government in favor of agricultural and other laborers, and against industrial laborers of other classes. Attention was drawn to that fact that persons entering the country to take employment in a manufacturing industry were required to have a certain sum of money, whereas agricultural laborers required no such qualification. Reference was also made to the new Steam Boiler Act of Ontario calling for the inspection of boilers under construction, to which the Legal Department had secured modifications.

Workmen's Compensation Report.

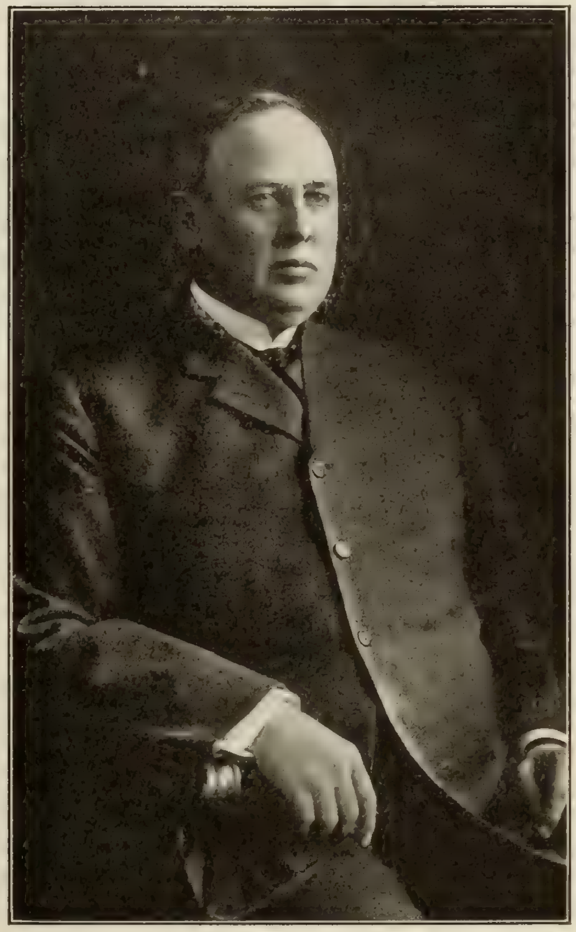
Chairman, P. W. Ellis. This was a special committee appointed to look into the proposed Workmen's Compensation system for Ontario, and to view the subject from the aspect of the whole Dominion. It was suggested that the committee be reappointed, so that its membership would have all the provinces represented. The committee reported that in Provinces where a Workmen's Compensation Act was in operation, employers were anything but satisfied with its operation. Referring to the proposed Act outlined by Sir William Meredith for the Province of Ontario, it was observed that no Government could consider seriously the adoption of Sir William's schedules or his Draft Act in their present form. It was proposed to await the action of the Government upon the report and draft. Energetic action on the part of the Association might be necessary, but the committee hoped that the Government would exercise the caution which the subject demanded. Because of the complex nature of the subject, a defect in any one of a score of features of a concrete system might mean the difference between failure and success, and, apart from the features of immediate interest to manufacturers, they were anxious to have the system adopted a successful and a model one. The committee desired to emphasize the importance of having the membership of the Association informed upon this subject, and, therefore, supplied the following questions and answers:

Tariff Committee.

Chairman, W. C. Phillips. The principal matters dealt with by the Tariff Committee comprised a large number of questions relating to the administration of the present Act, the extension of the British Preferential Tariff to a number of British Colonies not heretofore enjoying the preference, the renewal of the Japanese Treaty, and the tariff changes of last session which were largely necessary under the recent trade agreement between Canada and certain British West India colonies. Brief reference was made to the United States Tariff Bill, and to the fact that the Association's tariff officer was keeping in touch with the changes being introduced in this bill from time to time.

Technical Education Committee.

Chairman, J. S. McKinnon. This committee recalled the fact that since it first came into being in 1904, its activity had been centred on one objective—namely, the establishment of a comprehensive national system of industrial education, so planned as to take care of the needs of all classes and of all localities. Efforts were directed towards inducing the Federal Government to appoint a Royal Commission of Enquiry, and in 1910 the desired committee was appointed. The committee believed that the report placed at the disposal of the Canadian people would prove of inestimable value, not only in giving intelligent direction to, but in stimulating technical and vocational education of every kind in all parts of the Dominion. It was a little early to look for any definite announcement of the Government in this regard, but the committee had good reason to attach little importance to the rumors to the effect that the Government was indifferent. If the Ministers had refrained so far from committing themselves, it was only because of the unfortunate delays that have attended the appearance of the last two volumes of the report.



W. W. BUTLER.
Vice-President Canadian Steel Foundries, Ltd.

It was suggested that the Government may deem it wise to defer action until officially urged thereto by the Provinces. The Commission, it was pointed out, was appointed by the Laurier Government, and the present Government might with some justification demur at giving effect to its findings without some assurance from the Provinces that such action would be welcome. The committee suggested that no time should be lost in urging upon the various Provincial Governments the desirability of placing themselves on record as being entirely in sympathy with what the Royal Commission has proposed.

REPRESENTATIVE MANUFACTURERS AT THE CONVENTION.

THE following manufacturers' representatives travelled on the special C.M.A. train which left for Halifax on Saturday, September 13:

Anderson, W. J., Stratford Chair Co., Ltd., Stratford, Ont.
Benjamin, A. W., Benjamin Mfg. Co., Ltd., Yarker, Ont.
Benjamin, Mrs., A W., Yarker, Ont.
Bertram, Henry, John Bertram & Sons Co., Ltd., Dundas, Ont.
Bertram, Mrs. Henry, Dundas, Ont.
Bettesworth, A. E. A., Bush & Co. (Canada), Ltd., Montreal, Que.
Bristol, J. R. K., Manager Tariff Department, C.M.A., Toronto, Ont.
Bryan, F. W,, Manufacturing Co., Ltd., Collingwood, Ont.
Burton, E. S., Canadian Dyers' Association, Ltd., Toronto, Ont.
Burton, Mrs. E. S., Toronto, Ont.
Campbell, Jas. B., American Can Co., Montreal, Que.
Carlisle, C. H., Goodyear Tire and Rubber Co., Ltd., Toronto, Ont.
Champ, H. H., Steel Co. of Canada, Ltd., Hamilton, Ont.
Cheston, F. C., Canadian Linderman Co., Ltd., Woodstock, Ont.
Chown, G. Y., Wormwith Piano Co., Kingston, Ont.
Clarke, A. R., A. R. Clarke & Co., Ltd., Toronto, Ont.
Clarke, Mrs. A. R., Toronto, Ont.
Cleland, J. H., Meaford Wheelbarrow Co., Ltd., Meaford, Ont.
Cleland, Mrs. J. H., Meaford, Ont.
Cliff, Geo. J., Canadian Salt Co., Ltd., Toronto, Ont.
Cliff, W. C., R. D. Fairbairn Co., Ltd., Toronto, Ont.
Coe, R. T., Canadian Sirocco Co., Ltd., Windsor, Ont.
Coe, Mrs. R. T., Windsor, Ont.
Colby, J. R., Canadian Carbonate Co., Ltd., Montreal, Que.
Copping, Geo. R., Barber Paper & Coating Mills Co., Ltd., Toronto, Ont.
Copping, Mrs. Geo. R., Toronto, Ont.
Cowan, C. G., American Bank Note Co., Ltd., Ottawa, Ont.
Cowan, Mrs. C. G., Ottawa, Ont.
Currie, H. A., Wilson Bros., Ltd., Collingwood, Ont.
Currigan, Mrs. G. W., Stanbridge East, Que.
Daly, H., National Cash Register Co., Toronto, Ont.
Daniel, C. D., Toronto Pharmacal Co., Ltd., Toronto, Ont.
Desbarats, W. A., Desbarats Printing Co., Ltd., Montreal, Que.
Doolittle, E. A., Orillia, Ont.
Drewry, F. W., Edward L. Drewry, Winnipeg, Man.
Dunn, W. R., International Harvester Co., Ltd., Hamilton, Ont.
Dunn., Mrs. W. R., Hamilton, Ont.
Edmonds, W L., Commercial Press., Ltd., Toronto, Ont.
E. J. Leffert, Leffert Table Co., Berlin, Ont.

PRESIDENT GOURLAY'S INDUSTRIAL SUMMARY.

"Over-speculation has been checked, and the reign of business caution inaugurated.

"The key to the present financial stringency is that Canada is financing her rapid numerical and material growth and development on borrowed capital.

"Canada's huge indebtedness abroad has resulted in the inevitable. Supplies were, in part, shut off, carrying charges had still to be met, and the result was tight money.

"Criticism of Canadian banks is unjustified because they have acted the part of prudence and caution.

"Nothing can stop the progress of the wonderful country we boast as our heritage.

"We do not ask, nor do we want, higher duties all along the line.

"We are unalterably opposed to the lowering of tariff on goods of a class or kind made in Canada.

"It does not require much stretch of the imagination to picture Canada as a country celebrated for its shipbuilding."

Fairbairn, Ed., Ontario Wind Engine and Pump Co., Buffalo, N.Y.
Fairbairn, Mrs. Ed., Buffalo, N.Y.
Fairbairn, Rhys D., R. D. Fairbairn Co., Ltd., Toronto, Ont.
Firstbrook, John, Firstbrook Bros., Ltd., Toronto, Ont.
Firstbrook, Mrs. John, Toronto, Ont.
Fraser, A. W., Fraser Cap Co., London, Ont.
Fraser, Mrs. A. W., London, Ont.
Galbraith, H. S. Y., B. C. Mills Timber & Trading Co., Ltd., Winnipeg, Man.
Galbraith, Mrs. H. S. Y., Winnipeg, Man.
Gartshore, W. M., McClary Manufacturing Co., London, Ont.
Gordon, C. B., Dominion Textile Co., Ltd., Montreal, Que.
Gourlay, David R., Gourlay, Winter & Leeming, Toronto, Ont.
Gourlay, Mrs. David R., Toronto, Ont.
Gourlay, R. S., Gourlay, Winter & Leeming, Toronto, Ont.
Gourlay, Mrs. R. S., Toronto, Ont.
G. J. Stanley, Stanley Aluminum Co., Toronto.
Harris, Sam, Harris Lithographing Co., Toronto, Ont.
Harris, W. G., Canada Metal Co., Toronto, Ont.
Harris, Mrs. W. G., Toronto, Ont.

NOVA SCOTIA CONTINGENT.

On the membership list of the Can. Manufacturers' Association, Nova Scotia in general and Halifax in particular, are well represented. The list for 1912 for this Province totals ninety firms, and this year's additions have brought the number to only two short of the century. Of the grand total, Halifax boasts forty-two members. These up to date are:—

Amherst—Amherst Boot and Shoe Co., Ltd.—C. S. Sutherland.

Amherst Foundry Co., Ltd.—Wm. Knight.

Canadian Car and Foundry Co., Ltd.—Geo. T. Douglas.

Christie Company—J. A. Christie.

Eastern Paint Mfg. Co.—S. Hoffman.

International Works, Ltd., Oxford Worsted Co., Limited. The Rhodes, Curry Co., Limited—Herbert Lockwood, A. F. Felton, A. S. Curry (2nd) W. D. Piercy (3rd.)

Annapolis Royal—Mill, A. D. & Sons, Limited—C. W. Mills.

Antigonish—D. J. Kirk Woodworking and Construction Co.

Hygienic Fresh Milk Co., Ltd.—A. Lapierre.

Bridgetown—MacKenzie Crowe & Co.

Bridgewater—Telfer Bros.; Lahave Pulp Co., Limited—Frank Davison.

Canning—Blenkhorn & Sons, Limited.

Dartmouth—Starr Mfg. Co., Ltd.—H. Goudge.

East Apple River (Cumberland Co.)—White, Chas. T. & Sons, Ltd.—M. Garfield White.

Eastern Harbour, C.B.—Great Northern Mining Co., Limited.

Eureka—Nova Scotia Underwear Co., Ltd.—R. F. Archibald.

Halifax—Acadia Powder Co., Ltd.—T. R. Gue.

Acadia Sugar Refining Co., Ltd.—A. W. Daviss.

Barytes Limited—Henry H. Harrison.

Brander, Morris & Co.—W. R. Bran-

Brandam-Henderson, Limited — Geo. Henderson.

Clayton & Sons—W. J. Clayton.

Davis & Fraser—F. J. Fraser.

Dempster, James, Limited— A. F. Messervey.

Farquhar Bros.—James Farquhar.

Gunn & Co., Limited—E. Sullivan.

Imperial Oil, Limited—J. F. Shatford (2nd.)

Imperial Publishing Co., Ltd.—J. C. Stewart.

Kellys Limited—John F. Kelly.

Longard Bros.—J. P. Longard.

McAlpine Publishing Co., Ltd.—S. R. Frame.

Macdonald & Co., Ltd.—Roderick Macdonald.

Jno. MacInnis & Son.

A. W. MacKinley.

Moir, W. and A.—Alex. Moir.

Moirs, Limited—James W. Moir.

Mott, John P. & Co.—F. I. Ward.

Nova Scotia Car Works, Ltd.—F. M. Brown.

Nova Scotia Fertilizer Co.—C. M. Jack.

Reardon, Frank—Frank Reardon.

Robin Jones & Whitman, Ltd.—A. H. Whitman.

Scotia Pure Milk Co., Ltd.—Chas. N. Butcher.

Silver, H. R. Ltd.—H. R. Silver.

Smith & Proctor—N. B. Smith.

Smith, N. and M., Limited—Howard H. Smith.

Starr, John, Son Co., Limited.

Taylor, The Robert Co., Limited—R. D. Taylor.

Whitman, Arthur N.—Arthur N. Whitman.

Hantsport—Geo. Yeaton & Sons. Limited.

Kentville—Lloyd Mfg. Co.—John I. Lloyd.

Nova Scotia Carriage and Motor Car Co., Limited—G. Gordon Ferris.

La Have—J. F. Creaser Co.

Liverpool—Macleod Pulp Co., Limited—Sidney Downer.

MacClearn Co., Limited.

T. W. Quinn.

Londonderry—Londonderry Iron and Mining Co., Limited—J. P.Edwards.

Lunenburg—Lunenburg Foundry Co., Limited—T. C. Rockwell.

New Glasgow—Bailey, Underwood Co., Limited—John Underwood.

Canada Tool & Specialty Co., Ltd.—R. H. MacKay, M.L.A.

Cumming, J. W. & Son—Jas. T. Cumming.

Dand, Raymond—Raymond Dand.

Drake, Francis—F. H. Drake.

Eastwood, Jas.—Jas. Eastwood

Garrett, John E.—John E. Garrett.

Grant, John J.—H. G. Grant.

Johnson & MacDonald—J. B. Johnson.

Matheson, I., & Co., Limited—C. M. Crockett.

Nova Scotia Steel & Coal Co., Ltd.—Thos. Cantley.

Rood & MacGregor.

Thompson & Sutherland, Limited—H. T. Sutherland.

Oxford—Oxford Foundry & Machine Co.—H. W. Wood.

Oxford Mfg. Co., Limited.—J. A. DeWolfe.

Pictou—Atlantic Milling Co.

Hamilton, G. J. & Sons—H. H. Hamilton.

Sydney—Dominion Iron & Steel Company, Ltd.—J. P. McNaughton.

Dominion Tar & Chemical Co., Ltd.—The E. B. Smith.

Havelock Bottling Co., Limited—C. H. Stimpson.

Saunderson Mfg. Co., Limited—Arnold O. Saunderson.

Shaw and Mason, Limited—T. P. Mason.

Sydney Cement Co., Limited—H. C. Burchell.

Truro—Bigelow & Hood—J. S. Bigelow.

Durkee, A. A. Co., Ltd.—A. A. Durkee.

Eastern Hat and Cap Mfg. Co., Ltd.—Warren Oglive.

Spencer Bros. & Turner, Ltd.—L. Spencer.

Truro Paper Box Co.

Windsor—Colonial Fertilizer Co.—A. P. Clark.

Smith, J. E., & Co.—J. E. Smith.

Windsor Foundry & Machine Co., Ltd.

Windsor Furniture Co., Limited—F. A. Shand.

Windsor Plaster Co., Limited—C. Henry Dimock.

Yarmouth—Cosmos Cotton Company—G. H. Allen.

Minard's Liniment Co., Limited—C. C. Richards.

New Burrell-Johnson Iron Co., Ltd.—H. S. Crowell.

MARITIME PROVINCE CENSUS RETURNS.

THE following table is taken from the census returns of the Government, compiled in June, 1911, and gives a clear idea of the development which has taken place in the towns and cities of the three Maritime Provinces, namely, Nova Scotia, New Brunswick, and Prince Edward Island:—

Cities, towns and villages.	Population, 1911.	Population, 1901.	Capital, 1910.	Wages, 1910.	Products, 1910.
Nova Scotia	168,181	125,230	67,162,011	7,743,529	40,165,263
Amherst	8,973	4,964	15,763,768	1,147,427	4,625,765
Antigonish	1,787	1,838	35,000	14,411	88,850
Bridgewater	2,775	2,203	196,200	59,013	1,560,364
Canso	1,617	1,479	163,858	12,534	216,145
Dartmouth	5,058	4,806	1,681,396	200,775	1,145,059
Glace Bay	16,562	6,045	38,500	26,609	132,500
Halifax	46,619	40,832	14,068,713	1,735,348	12,140,409
Inverness	2,719	306	4,500	3,200	18,800
Kentville	2,304	1,731	248,077	103,052	307,935
Liverpool	2,109	1,937	111,300	38,500	186,500
Lunenburg	2,681	2,916	189,039	73,287	229,666
New Glasgow	6,383	4,447	1,063,398	346,466	1,034,572
North Sydney	5,418	4,646	159,500	53,360	168,900
Parrsboro	2,856	3,391	99,392	35,306	205,053
Pictou	3,170	3,235	380,000	94,474	627,538
Springhill	5,713	4,559	52,500	10,113	40,200
Stellarton	3,910	2,335	648,588	47,361	200,510
Sydney	17,723	9,909	24,623,033	2,231,327	9,395,017
Sydney Mines	7,470	3,191	1,935,000	287,618	2,540,161
Trenton	1,740	1,274	1,853,000	588,267	2,290,000
Truro	6,107	5,993	2,056,085	298,821	1,334,520
Westville	4,417	3,471	6,000	1,242	5,700
Windsor	3,452	3,398	244,432	114,414	472,723
Yarmouth	6,600	5,430	1,540,732	220,604	1,198,376
New Brunswick	90,241	81,449	22,125,518	5,531,212	23,084,334

MINCED MARITIME MATTERS.

THE Nova Scotia Steel & Coal Co. claims to be the first company to make coke in retort ovens.

Sydney contains the plant of the Dominion Iron & Steel Co., valued at $35,000,000.

The Dominion Coal Co., of Sydney, has recently installed a $500,000 coal washer.

Amherst, N.S. has grown from a village to a city in a few years by encouraging industries.

The capital invested in New Glasgow, N.S., has doubled since 1910.

The last convention of the Canadian Manufacturers' Association held in Halifax, was in 1902.

The Government has allotted $500,000 to build a dry dock in Halifax.

In Nova Scotia, there are thirty-five foundries and machine shops, in which are invested $277,000.

St. John, N.B., has grown tremendously since last census, when its population was placed at 42,511.

The population of Halifax in 1911 was 46,619.

In New Brunswick there are twenty-two foundries and machine shops, in which nearly two million dollars are invested.

Halifax harbor is free from ice the whole year round.

Of the 200,000 Canadians in Boston, a considerable proportion are ex-Nova Scotians.

Prince Edward Island, the smallest of the "Three Maritime Sisters," has never shone as a manufacturing province.

Halifax is the winter terminus of the steamboat systems, and all the year round of the Intercolonial Railway.

The young men of Yarmouth, N. S., have adopted the motto, "No Politics—Just Yarmouth," and the watchword, "20,000 in 1912."

A company with $10,000,000 capital will develop hydro-electric power, and extend the street railway lines into the suburbs of St. John, N.B.

"Come East, young man," and "Stay East, young man," are slogans adopted in the Maritimes.

Fredericton, the capital of New Brunswick, claims to supply the cheapest electrical power in the province.

Moncton, N.B., is headquarters of the Intercolonial Railway and the second largest city in New Brunswick.

St. John, N.B., was almost destroyed by fire in 1877.

Truro, N.S., is an important railway centre, with several important industries.

The Maritime Provinces---Facts, Figures and Features

The presence of the Canadian Manufacturers' Association Convention in Halifax N.S., and the visiting representatives' tour of the leading industrial centres of the territory forming the eastermost portion of the Dominion, have conspired to direct special attention to the progress and general importance of this section relative to our commercial well-being. The racy account here given will, we believe, be found interesting and instructive.

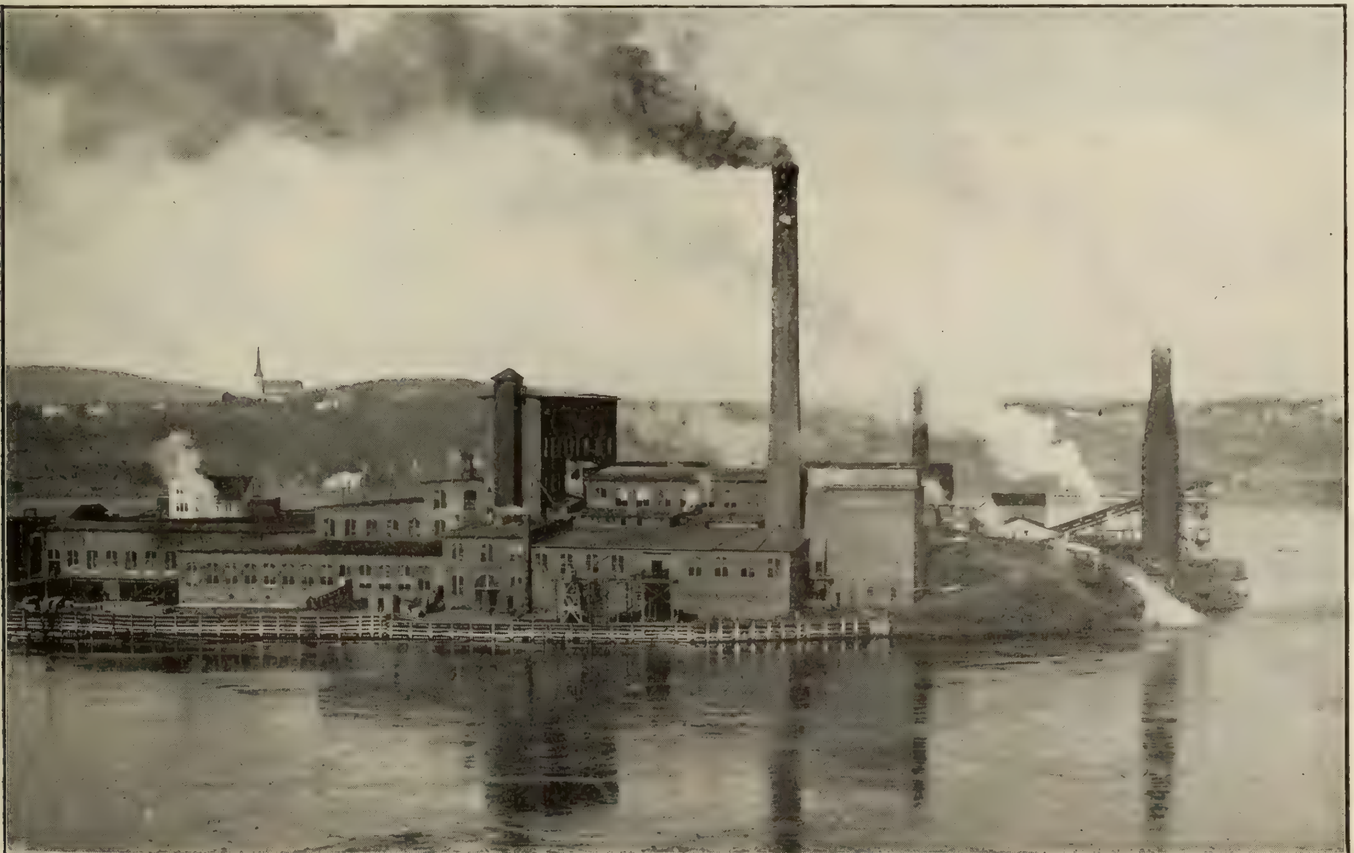
DESPITE the fact that this has been more or less of a trying year in industrial and commercial life not only in Canada, but throughout the neighboring Republic and other parts of the world, and the additional fact that the money market had been greatly depressed by various circumstances, actual or imaginary, the Maritime Provinces have plodded along in their even, steady trend of progress, and, with remarkably few exceptions, all big manufacturing houses and industrial concerns will give the same response when asked as to business prospects,—"Never better,." It is surprising, but it is nevertheless true, and reverts one to the old belief, tried and found generally correct, that it is better to go ahead cautiously, even if perhaps slowly, than to "boom" for a time and then be relegated to a position of comparative oblivion in respect to former ideals.

A Marked Steady Growth.

The growth of the three Atlantic Provinces in the industrial and manufacturing world during the last few years has been marked. It has not been slow in the exact meaning of the word, according to one Webster, in fact, if anything it has ben rapid, but the rapidity has been accompanied by a spirit of confidence and optimism that was not allowed to overwhelm all ideas of business caution. It is, however, now showing itself in the encouraging progress of the different towns and cities of the three coastal Provinces of Eastern Canada.

Some people have called it a boom. Others have objected to the term. They have heard of the several western "booms" some of which have exploded, but they have more faith in the possibilities of the eastern townships than fear of any "boom-busting." In the average sense of the word, however, there is a boom, a most persistent one that won't die in the Maritime Provinces, particularly in New Brunswick and Nova Scotia, and there is evidence of it not only in the larger cities but throughout the smaller townships as well The number of young men leaving the three Eastern Provinces for the United States and the Canadian West is not so great now as it used to be, and the trend of immigration will be directed more eastward than to the west in coming years.

The "Harvesters' Excursions" are meeting with quite general opposition from business men, manufacturers, press and public, for they have been a drainage for many years. W. Leonard Palmer, of the London, (Eng.) Financial News, in St. John, last week, spoke most cheerfully of the prospects of Atlantic Canada. He last year visited Halifax, St. John and other maritime centres with a large party of British manufacturers and capitalists on their tour through Canada, and said they were greatly interested in the development of these provinces. "So much so," said he in fact, "that I would not be surprised if within a short time you hear of British industries establishing themselves in New Brunswick or Nova Scotia. Trade conditions in the old country have been such this year that it has



EDWARD PARTINGTON PULP & PAPER CO. MILLS, ST. JOHN, N.B.

been impossible for business men to devote much attention to Canadian fields, but from now on, there will be a change, and the Maritime Province will reap the benefit of the trip of those English capitalists last year." Already, Mr. Palmer said, results of their tour had been shown in Quebec Province.

Progress Writ Large.

There is an old adage to the effect that "Seeing is believing." Well, it isn't a matter of extreme difficulty to see progress written in capital letters in these parts. During the last quarter of a century, things have been pretty well on the "hum," but it is within the last five or ten years that the spirit of industrial activity has been renewed on a more extensive scale than ever. Towns, that a few years ago were unheard of, now find a prominent place upon geographical maps as centres of industry, and the advance of such places as Sussex, Moncton, St. Stephen, Campbellton, Fredericton, St. John and other townships in New Brunswick; Amherst, New Glasgow, Stellarton, the Sydneys and Halifax in Nova Scotia, and Charlottetown and Summerside in P.E. Island, has been truly remarkable.

Factors at Work.

Various factors have had to do with this. Discoveries of iron and coal, the former particularly on the north shore of New Brunswick, and coal and iron in Nova Scotia have been responsible for different industries arising in those parts and towns such as Newcastle, Campbellton, Dominion, New Waterford, spring from mere villages into hives of commercial life. The growth of Sydney has gone along with great strides, the steel works and minor industries helping largely. New Glasgow, Stellarton, Trenton, and Westville together make another city grown upon coal and steel, with subsidiary industries adding to their healthy condition. Moncton has won fame through discoveries of natural gas and nearness to extensive oil areas, both tending to attract industrial concerns. Sussex promises to gain a wider reputation through natural gas; Fredericton is becoming noted as a "shoe town;" and there are many other places in the provinces by the sea which are deserving of mention.

THE T. S. SIMMS & CO. BRUSH FACTORY, ST. JOHN, N.B.

St. John and Halifax.

Primarily of course St. John and Halifax occupy the predominant positions when it comes to a question of industry and trade. They are Canada's winter ports, and as such their names are not confined to children studying the map of their respective province, but are known in all the larger centres of shipping and manufacturing. Merchants, and manufacturers in these cities have not been doing as has been done in the west, "spending too freely and spreading too fast;" then intoxicated by prospects of present success, not looking far enough into the future. No that is not the policy of the directors of industrial destiny in these parts. The old motto "slow but sure" is good enough, provided it is not too slow.

Probably the greatest advantage any industrial city can have is facility for shipping besides nearness to natural products. St. John and Halifax have both of these. Each with an excellent harbor is the centre of Canada's winter trade. So much so is this the case that the Federal Government, realizing the importance of both ports, has issued contracts for work involving millions of dollars in the creation of dry docks, wharves, breakwaters, grain conveyors, etc., while the railways are spending thousands of dollars yearly upon the development of their properties there.

With the general advance of harbor development has come a "boom" so-called, to each city, and its beneficial effects have been reflected throughout the Provinces as a whole. New industries have been attracted, and there has been an expansion of home endeavor. Trade has increased, and the volume of business handled at each port during the winter season has seen an annual enlargement. So much so is this apparent in St. John, that only within the last week, an outside shipping company, the "Red Cross Line" made application for accommodation for a line of steamers between New York and that port, but it was found that there was no berth available so much occupied were the existing harbor accomodations. An effort will, however, be made to provide the line with wharfage.

Real estate has almost trebled in value in both places, within the last two years. The populations are increasing and, of course this may be said regarding many other towns throughout the Atlantic provinces. The people are beginning to take a more active interest in general affairs, and there is more confidence in commercial and industrial endeavor than ever before. The Boards of Trade are earnestly working in the interests of the two ports for the securing of new industries, bettering general civic conditions, increasing the population, and in other ways with the co-operation of the citizens, while working hand-in-hand with the civic governing bodies, are exerting themselves to have Halifax and St. John recognized as modern Liverpools in the world of commerce, trade and industry.

Canadian Cement Co. and St. John, N.B.

Much interest in being evinced in local trade and manufacturing circles over the announcement made by H. L. Doble, of Montreal, comptroller for the Canada Cement Co., that his company intended establishing in or near St. John a million dollar plant having a capacity of 1,000 barrels a day, and employing about 150 men. While nothing definite has been said regarding a site, it is understood that the factory will locate in the vicinity of Model Farm, about ten miles from the city, but still not so far as to prevent the city from reaping the advantage of the plant being there.

Grain Conveyor Contract.

The J. S. Metcalfe Co., Ltd., has been awarded the contract of building the additional grain conveyors at the west side of the harbor for the Government, the approximate cost being about $140,000. It is hoped that the new conveyors will be ready for use this winter, as they are greatly needed to handle the increased trade.

Copper Mining.

Copper mining on an extensive scale may be developed in Kings County, N. B., through the discovery of what is said to be very rich ore at Scotch Settlement. In most places, prospectors have struck the mineral four feet from the surface. A company is to be formed which will mine the area, and establish permanent camps, and it would not be surprising if within a short time an important mining town springs up in the vicinity.

* * *

FREDERICTON, N.B.

FREDERICTON, the capital of New Brunswick, the last of the maritime centres visited by the party of Canadian manufacturers, stands on a piece of high intervale on the west bank of the Saint John river, eighty-four miles from its mouth. The site of the city is both picturesque and pretty, and commands a magnificent view of the famous river. In this city of about 10,000 inhabitants, a great deal of manufacturing is carried on, important legislation enacted, and hundreds of students are annually turned out from the leading academical institutions. The most important industries are: The Hartt Boot & Shoe Co., employing 250 hands; the Canadian Cottons, Ltd., 800; the John Palmer Co., Ltd., 150; Palmer-McLellan Co., Ltd., 150; Chestnut Canoe Co., Ltd., 60; Risteen Co., Ltd., 40; M. Ryan & Sons, Ltd., 50; McFarlane, Neill Co., 40; Smith Foundry Co., Ltd., 40 employes, and many other smaller concerns. Fraser, Ltd., lumbermen, operate a large mill, employing about 200, while the York & Sunbury Milling Co., Ltd., and the Babbitt Lumber Co., Ltd., operate smaller lumber mills.

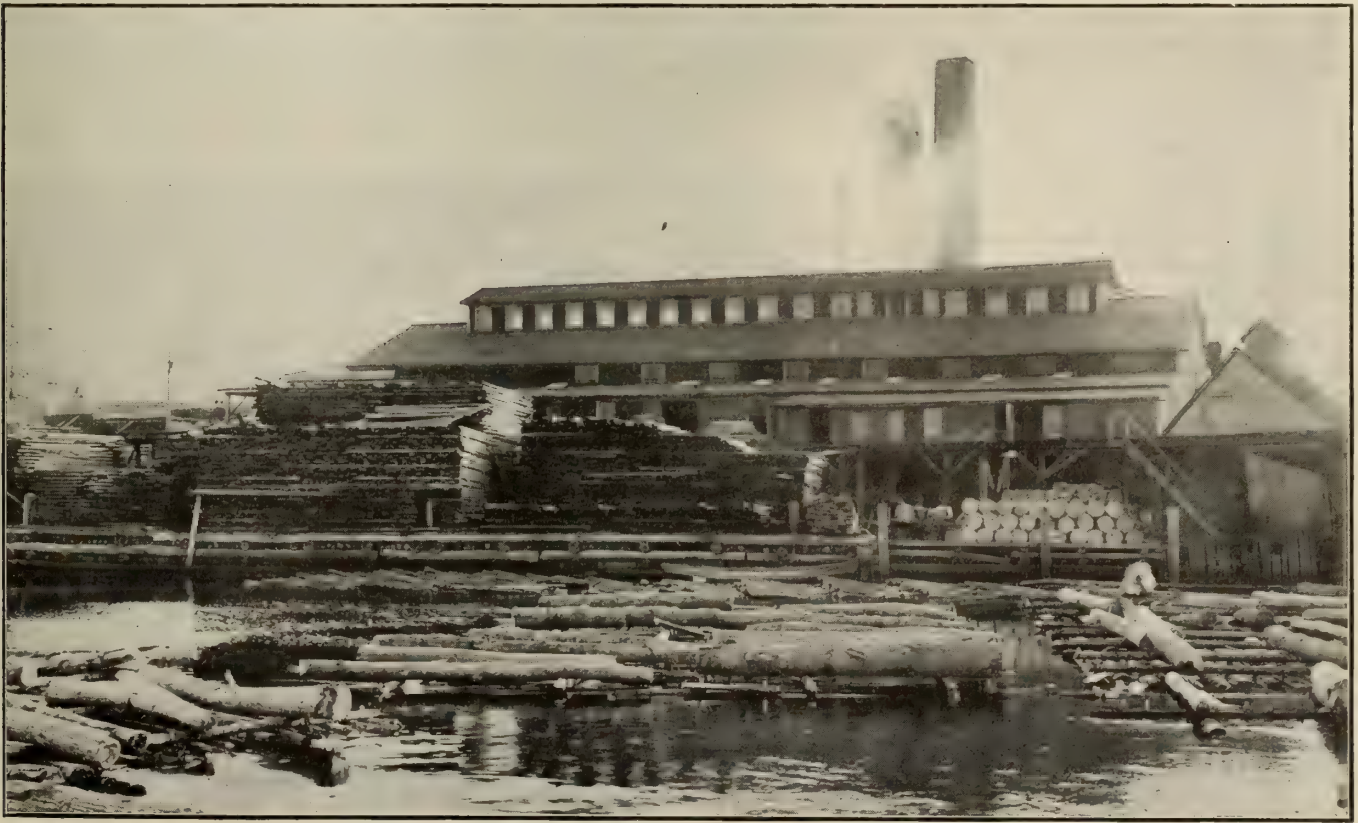
The city enjoys desirable transportation facilities both by rail and water. In addition to an adequate river service, Fredericton is served by the Canadian Pacific and the Intercolonial systems, and enjoys competitive freight rates to Western Canada. The Fredericton and Grand Lake Railway has this month been completed, and will be operated as part of the C.P.R. In addition to opening up a large agricultural district, the railway will also serve to bring the products of the Grand Lake coal mines to Fredericton at a much lower cost.

Power charges in Fredericton are very reasonable, while three new companies have been formed to develop the natural water powers on the Saint John River. Very generous concessions in the way of a free site, free water and exemption from taxation for a definite period of years will be granted by the city to sterling, bona fide industries.

In Fredericton are situated the Parliament and Departmental Buildings, the University of New Brunswick, the Provincial Normal School, the Fredericton High School and the Fredericton Business College, all striking structures of elaborate design.

Building activity in Fredericton continues brisk. Falconer and Macdonald have the work on Fredericton's large new post office well advanced. The Maritime Bridge Co., Ltd., of New Glasgow, who have the contract for the structural steel for the building, have practically completed their contract. The Ryan Construction Co., Ltd., are rushing operations on the erection of the large addition to the Provincial Normal School. The new building for the Royal Bank of Canada is nearing completion, and the Canadian Cottons, Ltd., will commence the operation of their new machinery in the immediate future. The company are desirous of securing additional female help.

On the river front, the Foundation Company, Ltd., are working day and night crews on the re-erection of the large pier of the Fredericton Highway Bridge, while Forbes & Company, Ltd., are building a concrete wharf for the



MURRAY & GREGORY LUMBER MILLS, ST. JOHN, N. B.

Dominion Government in the rear of the City Hall property. Smith, Merrithew & Company, Ltd., have finished their contract on miles six to sixteen north of Fredericton on the Saint John Valley Railway, and have taken contracts for the erection of buildings at the Experimental Station.

AMHERST, N.S.

AMHERST is a bustling manufacturing town in Nova Scotia which, in a score of years, has seen its industries grow from small workshops to great manufacturing plants. In 1900, it had neither a sewerage system nor a paved street. To-day it has both, and its annual exports total over seven million dollars, which represents a production of over $700 per inhabitant.

PRODUCTS OF THE INTERNATIONAL ENGINEERING WORKS, LTD., AMHERST, N.S.

Among its largest industries are the following:—

The Canadian Car and Foundry Co., with which are included the Rhodes Curry Co., the Malleable Iron Works and the Rolling Mills; occupying about fifty acres of ground. The Amherst branch of this concern differs materially from nearly all other car works on this continent, in that most of them are merely assembling shops. The Amherst branch produces almost everything entering into the construction of the cars built there, and supplies various other car works throughout Canada with parts. The annual output of this company is worth about $3,500,000. The pay-roll amounts to more than $600,000 a year, and from 1,200 to 1,500 men are employed. The Rhodes Curry branch does a business in the Amherst department, of $250,000 yearly.

The Robb Engineering Co., manufacturers of engines, boilers, general machinery, etc., employ 400 men. The annual pay-roll is $250,000, and the output $1,000,000 a year.

The Amherst Foundry Co., manufacturers of enamelware, steam furnaces and ranges, employ 150 men, whose total yearly wages amount to $80,000. The annual output is $300,000.

Six miles from Amherst is situated the village of Chignecto, the headquarters of the Maritime Coal, Railway & Power Co. This is the only place in the world where power is generated at the mouth of the mine and transmitted for manufacturing purposes. When this plant was opened, a telegram of congratulation was received from Thomas A. Edison, on whose suggestion it was built. In this telegram he stated that "he was delighted that the first plant of its kind on the continent should have been erected in the Province in which his father was born."

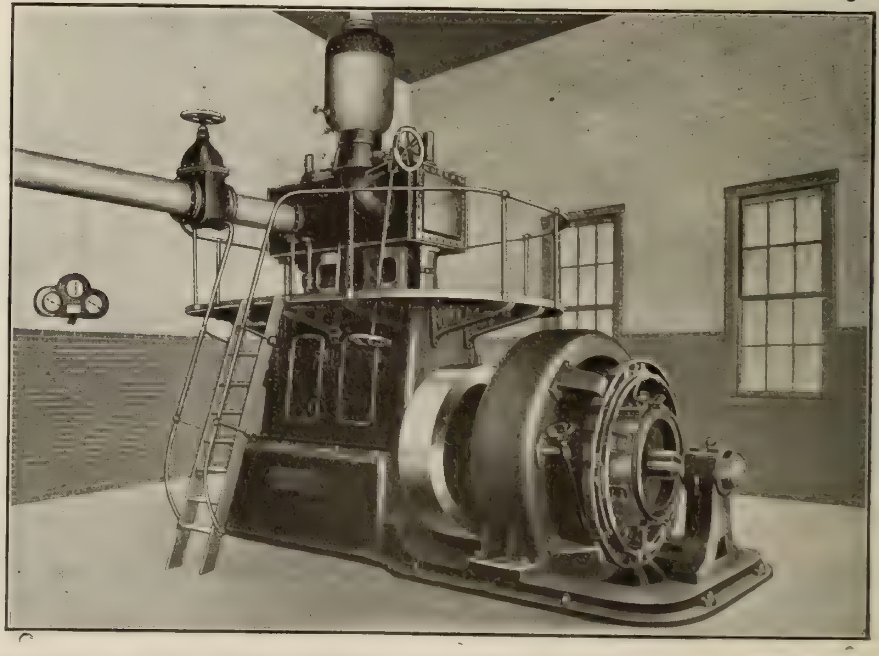
Coal has been an important factor in the development of Amherst. Within a radius of from six to twenty miles from the town are situated some of the best coal-fields of the East. Among the larger coalfields are Springhill, also the mines of the Maritime Coal, Railway & Power Co. at Chignecto and Joggins, as well as Minudie and River Hebert. Many smaller mines are also being developed.

The Maritime Gypsum Co.'s Works are located within three miles of Amherst. Here about 100 men are given steady employment. The company has its own railway and wharves, and shipment of plaster is made direct to New York by steamer. The annual output of plaster is in the vicinity of 75,000 tons, and it is estimated that this property alone is capable of producing 3,000,000 tons of plaster. The works are operated by electrical power supplied by the Maritime Power Co.

ST. JOHN, N.B.

FIVE years ago St. John, New Brunswick, was one of the most conservative cities in Canada. When it was proposed to take up the American idea of city building and progress, the reply was something like this—" That will not do here. We are too conservative." A few of the citizens, however, started a movement, the success of which has surprised even the most optimistic, and today stands as a lesson to other backward-looking cities.

St. John has entered upon a period of industrial expansion of considerable magnitude. So much so that it is attracting outside capital, and local men are taking up projects of large enterprises That the Government and the railways anticipate a great increase in business is evidenced by the many millions of dollars being expended at the present time in building docks, breakwater, grain elevators and conveyors, railway terminals and extension of elec-



PRODUCTS OF THE INTERNATIONAL ENGINEERING WORKS, LTD., AMHERST, N.S.

tric railways. The building of a great hydro-electric plant, bringing natural gas to the city, development of coal and iron areas, will bring many new industries. Courtenay bay will be surrounded with wharves and breakwater, and have one of the largest dry docks in the world.

C.M.A. Greeting.

In the greeting which was extended to the Canadian manufacturers on their recent visit to the Maritime Provinces, the St. John Board of Trade stated:—"St. John is experiencing an era of prosperity and progress not equalled in Eastern Canada, and we want you to see with your own eyes the evidence of the optimistic spirit of the citizens who, with the Dominion Government and railways, are expending $50,000,000 in new developments and improvements, including post office, theatre, banks, armory, sugar refinery, grain elevators and conveyors, industrial plants, warehouses, dry docks, breakwater, wharves, etc. Let us show you."

Industrial Development.

The Atlantic Sugar Refinery Company have well under way the sugar refinery, which is to cost, with equipment, in the neighborhood of $3,000,000. It is to be completed and in operation within a year, turning out 2,000 barrels of sugar a day, and employing 600 men. The Canada Cement Company, realizing that the great demand for cement in the extensive building operations which are under way and projected, will cause a big demand for their product, have decided to build a million dollar plant near the city. The Maritime Motor Car Company have completed an automobile factory, large enough to turn out 1,000 cars a year, and afford employment to a large number of men. The T. S. Simms Company have erected a brush and broom factory. The Canadian Brush Company also recently completed a factory building. T. McAvity & Sons will erect a foundry and machine shop at an estimated cost of $1,000,000. The Partington Pulp and Paper Mills have been building an extension of the C.P.R. tracks to their plant, and have greatly increased the production of their large pulp mills. The Board of Trade have negotiations on with several manufacturers with a view to their establishing another pulp mill, oil refinery and other smaller industries.

Raw Material Feature.

The close proximity of raw materials, geographical position and transportation facilities by both rail and water, are bound to make St. John a great industrial centre. It already has the Canadian Pacific and Intercolonial railways, and within a short time will have the Grand Trunk Pacific and Valley Railways, both of which will have terminals and wharves at St. John.

WORK TRAIN, FREDERICTON AND GRAND LAKE RAILWAY.

* * *

HALIFAX, N.S.

HALIFAX is a favorable location for manufacturing successfully. It is situated at a focal point of three important systems of railway with convenient coastal and ocean communications, and has one of the finest harbors in the world. It has steamer communication to all parts of the world, and its assembling advantages of raw material can hardly be surpassed.

At the present time there are some sixty manufacturing industries in the city, a number of them competing successfully for a share of the trade, not only of Western Canada and the American markets, but of those abroad.

The Ideal City.

All roads lead to Halifax. Its advantages as a manufacturing and living point are many. From its geographical position, practically surrounded by water, it has advantages over every province in the Dominion, with one exception, in being able to assemble materials for manufacturing, as water borne freight, which on account of its cheapness, in comparison with other locomotion, gives a very great advantage to the manufacturer. Another great advantage is that Halifax is located centrally in a province that has among its natural products the essentials for manufacturing—a railway haul of 4 hours will place the best Pictou and Cumberland coal, and the vast coal fields of Cape Breton all

CANADIAN SARDINE CO. WORKS, ST. ANDREWS, N.B.

within one hour's run by rail. In the forests are found woods of great variety for the manufacture of furniture and wood work of all kinds. The minerals are abundant and of great variety, the minerals and mineral product of the province last year being valued at $37,000,000.

Steamer Connections.

Halifax has advantages over New York in the matter of distance to other great ports of the world. To Cape Town, South Africa, the distance from Halifax is 4,623 miles as compared with 6,640 miles from New York; to Sydney, New South Wales, it is 12,980 miles from Halifax, against 13,245 miles from New York.

At the present time Halifax has steamship connection with London, Liverpool, Bristol, Manchester, Glasgow, Dublin, Havre, Antwerp, Rotterdam, Libau (Russia), Cape Town, Port Elizabeth, Australia, New Zealand, Cuba, Mexico, West Indies, St. John's (Newfoundland), Jamaica, New York, Boston, Portland, St. John, N.B., Prince Edward Island, and St. Pierre et Miquelon. A very large number of sailing vessels embark and discharge cargoes at Halifax at all seasons of the year.

Halifax also enjoys the advantages of a number of steamboat lines to principal ports in the Maritime Provinces, and the cheap rates in connection with the water borne freight give it a very great advantage as a distributing point. Besides these steamers there are a number of schooner packets—this service constituting an important shipping medium with merchants, especially for heavy goods, and aids materially in preventing freights from becoming unreasonable and exorbitant.

In regard to railway connections, Halifax is the terminus of the Intercolonial Railway, the Dominion Atlantic Railway, the Halifax and South Western Railway, and the Halifax and Eastern Railway, the latter now under construction. It is also the proposed terminus of the Canadian Pacific Railway, the Grand Trunk Pacific Railway, and the Canadian Northern Railway.

Business Openings.

Halifax holds out exceptional advantages for furniture factories, locomotives works, shirt and collar factories, glove, button and hosiery factories, wire fencing, etc., as all materials in connection with the manufacture of these can be assembled probably cheaper than at any other point in the Dominion. There are also splendid openings for market gardening, small fruit culture, the preserved and canned fruit industry, etc.

Halifax boasts certain factories which supply the market for their kind of products, not only in the Maritime Provinces but also in Western Canada. It is the seat of the sugar manufacturing industry of Eastern Canada. The Acadia Refining Co. have now neared the construction at Woodside, on the site of the burned refinery, of a plant that will be the largest in Canada. When this building is completed, the company will have a capacity of 4,200 barrels per day, or practically half the daily consumption of sugar in Canada. It is estimated that the new Woodside buildings and plant, when completed will have cost $3,000,000.

Another of the established industries is the manufacture of paint; branch factories and warehouses are conducted in St. John, New Brunswick, Montreal, P.Q., and Winnipeg, Manitoba.

One of the largest clothing factories in Canada is also situated in Halifax, and a goodly portion of its output is obtained from a cloth mill owned and operated by the firm and situated in the interior of the Province in one of the wool growing sections. One of Canada's largest confectionery and biscuit factories is also situated in the city with a trade extending to the Pacific Coast.

The Nova Scotia Car Works give employment to a large army of men, and is one of the most modern and complete plants of its kind in Canada, having an output of twenty cars a day. A large cotton factory gives employment to some 500 hands.

Besides the foregoing, there is a large boot and shoe factory, large wood working mills, three large breweries, machine works, cold storage plant, a large cordage factory and numerous other factories generally found in a commercial centre.

C.P.R. STEAMSHIP "ST. GEORGE" LEAVING ST. JOHN, N.B., FOR DIGBY, N.S.
This vessel was recently purchased by the C.P.R. from the Great Western Railway Co. of England.

* * *

Canadian Seamen to be Rewarded.—For rescuing the master and crew of the American schooner Henry R. Tilton at sea on December 12 last year, Captain James Publicover, of La Have, N.S., will receive a gold watch and Seaman R. Richards a gold medal from the President of the United States. Both rewards have been received by the Canadian Marine Department for presentation.

With the Canadian Manufacturers To and From Halifax

Told by our special correspondent in a few sentences, yet sufficiently indicative of the pleasantries and other experiences of the trip as to stamp this preliminary and sequel to the Annual Convention, with the whole-hearted approval of its participants.

A SPECIAL train pulled out of Montreal station on Sunday night, Sept. 14, bearing 175 Canadian manufacturers bound for the C.M.A. Convention at Halifax. The majority had come from Toronto and Ontario, with just a sprinkling from Montreal and the West.

The train reached St. Andrews, N.B., at noon the following day, where the manufacturers were guests for luncheon at the Algonquin Hotel. Among those who welcomed the visitors were Sir William Van Horne, Mayor King Greenlaw, and the Hon. W. C. H. Grimmer.

After luncheon, a number crossed Passamaquoddy Bay to Eastport, on the steamer St. Andrew's. Others accepted an invitation to Sir Wm. Van Horne's summer home on Minister's Island, where they played golf, bowling and tennis. Some motored to St. Stephens.

For their hospitality, the management of the Algonquin Hotel were thanked as follows: Mr. R. S. Gourlay, president of the C.M.A. spoke in warm terms of St. Andrew's and vicinity; R. D. Fairbairn, Toronto, moved a vote of thanks, and A. R. Clarke, Toronto, said New Brunswick manufacturers were men of the highest type, and bound to make their mark.

At night the party left, passing through St. John, N.B., at three in the morning, and arriving at Truro, N.S., an hour behind time. It was decided not to make any more stop-overs, or the convention might be delayed.

The Tender Jumps Track.

Nevertheless, there was an unavoidable stop-over on the track between Truro and Windsor. While the party were at luncheon, something happened that might have denuded Canada of its leading manufacturers. The tender jumped the track, and it was some time before the engine could be stopped. There was a delay of twenty minutes, but no casualties.

Arrival at Halifax.

The train arrived in Halifax on Tuesday afternoon. At night, Premier Murray and Mayor Bligh welcomed the delegates in the Technical College. F. B. McCurdy, M.P., President of Halifax Board of Trade, was also present. Thomas Cantley, general manager of the Nova Scotia Steel & Coal Co., Ltd., took occasion to criticize strongly the management of the Intercolonial Railway for increasing its freight rates.. He also took advantage of this opportunity to give his fellow-manufacturers a dig in the ribs. He charged them with importing much free steel and getting a duty on the finished products. He was pleased also to take a dig at the Government on the tariff question. The situation of the steel makers, he said, was becoming intolerable.

This ordeal over, Mr. R. S. Gourlay, president of the C.M.A. observed, when returning thanks for the welcome, that the Canadian Manufacturers' Association aimed at the spiritual development as well as the industrial development of the country.

Convention Business.

The first business meeting held by the C.M.A. commenced at the Technical College on Wednesday morning.

At ten o'clock, the president, Mr. R. S. Gourlay, of Toronto, walked on to the platform, accompanied by Mr. G. M. Murray, the general secretary; and Mr. C. B. Gordon, vice-president. The minutes of the previous meeting were considered as read, and the reports of the secretary and treasurer were gone over. The president then delivered his address, at the conclusion of which he was loudly applauded.

ROBB ENGINEERING CO. LIMITED.
ROBB

NOON HOUR AT THE MACHINE SHOP, INTERNATIONAL ENGINEERING CO., LTD., AMHERST, N.S.

Before adjournment for lunch and during the afternoon session, the reports of standing committees were read, each of which was followed by discussion. The prevention of tobacco smoking and accumulation of rubbish in factories was urged, following the report on insurance.

The report on technical education drew the lengthiest and most interesting discussion. Dr. Mackay, superintendent of education for Nova Scotia, spoke in favor of the scheme as outlined by the Royal Commission.

Mr. A. W. White, of London, Ont., pleaded for the boy in the country, and objected to technical schools being centralized. Vocational education he considered preferable to technical education. Mr. White spoke of the average bachelor of science as being a man who could make a splendid blue print, but his practical education generally ended there. To improve matters he advocated vocational education at an early age. This gentleman went further, and deprecated the system of holding matriculation examination to secure entrance to a technical college. Boys should be eligible, he believed, after passing an examination in lower mathematics.

After Dr. Mackay had assured Mr. White that vocational work was provided for in the report of the Royal Commission, Mr. C. B. Gordon deplored the class of labor available in Canada to-day, and recommended the expenditure of money in the very rudiments of technical education.

Wednesday Afternoon.

At the afternoon session, following the report on Railways and Transportation, Mr. R. O. Fairbairn, of Toronto, read a paper in which he urged the public ownership of some transcontinental railway, preferably the C.N.R.

Mr. S. R. Parsons, chairman of the Transportation Committee, thanked Mr. Fairbairn for his paper, but feared the scheme impracticable. He gave several reasons why.

Mr. E. G. Henderson, of the Canadian Salt Co., Windsor, Ont., who is the new vice-president, threw cold water on the suggestion lavishly. What did the paper propose? And there was no resolution appended. He predicted financial disturbance if such a thing were attempted.

Reading the Tariff Report.

By the time the report of the Tariff Committee was ready for reading, manufacturers were somewhat of a rarity in the technical college. It was getting late, and many of the delegates had wives and daughters who were outside enjoying themselves.

Mr. A. Saunders, of Goderich, suggested that the tariff report, being important, should be held over until the following morning. Mr. Thomas Cantley, general manager of the Nova Scotia Coal & Steel Co., while appreciating the delivery and elocution of those who read the reports, thought the reading rather childish, as all had copies of the report in their hands.

As a compromise, only the important points in the tariff report were read. The suggestion was then made that the tariff points be discussed by groups of manufacturers interested before referring them to Ottawa. Mr. Gourlay thought this excellent.

GEORGE BOOTH,
Treasurer Canadian Manufacturers' Association.

At the Wednesday evening session changes in by-laws were discussed, including one to make the date of the annual meeting earlier, to appoint an executive committee, to eliminate Provincial vice-presidents from the list of officers, etc.

Thursday Morning.

The report of the parliamentary committee was read at the opening of the Thursday session, following which a motion for the appointment of a special committee on the Bankruptcy Act was passed, after much opposition.

Mr. White of London, took part in a discussion during which the statement was made that the credential sales legislation in Alberta tended to encourage crooks. President Gourlay said the association would work hand in hand with the agriculturists.

The Western Grain Growers having sent a letter to the meeting requesting the help of the Association in securing British preferential tariff, Mr. Gourlay, president, wired that they were always willing to confer with them on matters of mutual concern.

The enormous damage done by fires in the Dominion was the subject of one discussion, and the incoming insurance committee were asked to do their best to awaken members to sense of the danger of fire.

Election of Officers.

During the morning, the following officers were elected for the coming year:—President, C. B. Gordon, Montreal; first vice-president, E. G. Henderson, Windsor, Ont.; second vice-president, J. H. Sherrard, Montreal; treasurer, George Booth, Toronto; auditor, Wilton C. Eddis & Sons, Toronto. Chairmen of Committees: Tariff, H. H. Champ, Hamilton; transportation, S. R. Parsons, Toronto; legislation, Thomas Findlay, Toronto; membership, N. A. Howie, Toronto; insurance, H. W. Fleury, Aurora, Ont.; technical education, H. H. Mason, Toronto; workmen's compensation, P. W. Ellis, Toronto.

Thursday Evening.

Following an excursion around the harbor in the afternoon, the delegates wound up their business in Halifax with a banquet in the Halifax Hotel, at which Premier Borden, Premier Murray and Mr. C. B. Gordon, the newly elected president, were the principal speakers. Mr. Borden's speech lasted for twenty minutes. He avoided politics throughout, his remarks being mainly based on the rich resources of Nova Scotia and Canada.

Mr. Gordon went deeply into the tariff situation. While not advocating a general revision of the tariff, there were several discrepancies which called for the immediate attention of the Government, chiefly concerning iron and steel. Protection, he argued, was given to this industry with one hand, and taken away with the other.

He did not think this schedule called for any adjustment that would cost the consumer a penny, but rather required internal adjustment, so that the rates would fall on the different manufactures of iron and steel, where they would afford proper protection to the amount of capital invested in the steel business.

The banquet closed at midnight so as to allow the delegates to catch a train which departed from Halifax at two o'clock.

Friday Morning.

Early Friday morning the long train carrying the manufacturers, drew into the depot at New Glasgow, N.S. The party were taken in autos to the plant of the Nova Scotia Steel and Coal Co., at Trenton. Two hours were spent in the works, Mr. Thomas Cantley, the general manager, with a large staff, escorting the visitors around. From the steel works they went to the new plant of the Eastern Car Co.

Another plant visited was that of the Standard Clay Products. Cars were placed at the disposal of the party by the Pictou County Electric Co.

The Mayor of New Glasgow, speaking to the party later, stated that if any of the Ontario manufacturers were contemplating a change of location, they should go to New Glasgow. The party was cheered as the train drew out.

Amherst, N.S., was reached at 2.30 Friday afternoon where they were welcomed by a committee which included George T. Douglas of the Canadian Car and Foundry Co.

Seventy-five motor cars were required to carry the visitors and citizens through the town. A visit was made to the plant of the Canadian Car and Foundry Co. On the return journey a visit was paid on Saturday to St. John, N.B., and later in the day to Fredericton, leaving at 10 p.m. The party reached Toronto on Sunday night.

* * *

C.M.A. CONVENTION NOTES.

THE manufacturers held a smoker and concert after their Wednesday evening session. The music was appropriate. There were three songs: "Boys of the Old Brigade," "The Veteran's Song," and "Go to Sea." Over two hundred were present.

Several amendments to the by-laws of the Association were adopted.

Toronto sent the largest contingent of manufacturers to the convention.

On Wednesday evening the delegates were given a moonlight sail in Halifax harbor.

It was decided this year to spend $1,000 on scholarships for research work in the universities and colleges.

At the close of the Convention about a dozen votes of thanks were passed to various parties for kindness shown.

Dundas was represented by Henry Bertram of John Bertram & Sons, the well-known manufacturers of machine tools.

Winnipeg put in strong claims for the convention to be held there in 1914. The matter was referred to the Executive Committee.

One of the Halifax papers referred to Mr. G. M. Murray as the grand secretary of the Canadian Manufacturers' Association.

The Technical College, where the manufacturers conducted their business, is the first state-owned institution of its kind in America.

Mayor Bligh spoke blithely of Halifax weather until Thursday afternoon, when rain was sent as an accompaniment to a harbor excursion.

Prior to the arrival of the delegates at Halifax, the Nova Scotia branch of the C.M.A. held their annual meeting for the election of officers.

Mr. G. M. Murray, general secretary of the C.M.A. in his report, stated that a new "trade index" costing $10,000 was being brought out.

On their return visit to St. John, N. B., the delegates were shown around the huge Atlantic Sugar Refining plant, which is nearing completion.

The Royal Canadian Regiment gave a concert in the public gardens on Wednesday afternoon, when special favors were accorded the C.M.A. delegates.

Many of the delegates from Central and Western Canada were unable to secure accommodation on the eleven-car special train from Montreal, and came by regular trains.

Mrs. McLaughlin, wife of R. S. McLaughlin, of the McLaughlin Motor Car Co., Oshawa, Ont., won a pin of tourmaline and pearls at a whist party held at the Waegwoltic Club.

At the reception given to the delegates on Tuesday night, a late start was made owing to the train being behind time. Fortunately all the speeches were of pleasing length.

On the walls of the Technical College where the meetings were held, were pictures of the most prominent factories in Nova Scotia, while near the platform were samples of grains and fruit.

Mayor Bligh of Halifax, in his welcome to the delegates, stated that he had instructed the police to give the visitors liberty of action, so that they might enjoy themselves in their own way.

During the Wednesday morning session, President Gourlay announced the extension of privileges to visiting members of the C.M.A., by the Halifax and other city clubs, as well as by the Halifax Golf Club.

Mrs. W. R. Dunn, wife of W. R. Dunn of the International Harvester Co., Ltd., Hamilton, won a necklace of oxydized silver and enamel, set with moonstones, at a whist party held at the Waegwoltic Club on Wednesday night.

A large percentage of those attending the convention were manufacturers of iron and steel or metal goods, and therefore readers of "Canadian Machinery." Practically all those from Hamilton were connected with the steel and subsidiary trades.

Mayor Bligh in welcoming the C.M.A. reminded the delegates that Halifax was the gate of Canada. Mr. Gourlay in reply, stated that it was not enough to be a gateway. They must look back of the gateway to the power which held the people after they came.

SOCIAL SIDE OF THE C.M.A. CONVENTION.

SCORES of manufacturers took their wives to the Convention at Halifax. Many took their daughters. Few took their sons. As ladies are not much interested in grain growers, workmen's compensation, and tariffs, it was necessary to find something for them to do during the two days spent in the Nova Scotian capital. At ten o'clock on Wednesday morning the party were conveyed in automobiles to Bedford, Waverley, and Dartmouth, returning to the hotels at noon for luncheon.

In the afternoon there was a band concert in the Gardens, at which the blue and white ribbon of the C.M.A. visitors was conspicuous. Music was provided by the R.C.R. band. The ladies were later received at the Woman's Council House, the hostesses being Mrs. William Dennis, president of the local council, Mrs. J. C. Mackintosh, ex-president, and others.

In the evening the Waegwoltic grounds had been transferred into a fairyland with electric lights. At the club house a whist party was held. Some however, preferred the water. Supper was served in the cafe, where the Academy orchestra rendered a musical programme.

After the banquet on Thursday night, the visiting manufacturers, ladies, and officials, proceeded to North Street where they gave a dance, which was attended by a number of Halifax people. A Canadian Pacific dining car had been cleared of its tables and fitted up as a miniature ball room, where there was dancing for an hour or so to the music of an orchestra. It was a jolly affair.

Harbor Excursion.

Prior to the banquet, the manufacturers and ladies were taken for a sail in the harbor. Rain fell, but it scarcely marred the pleasures of the day. The decks of the "Lady Laurier" were covered with awnings, and comfortable accommodations were provided for all the guests.

The Lady Laurier left the Plant wharf shortly before three o'clock, going northwards almost to the narrows before swinging around for the sail down the harbor and up the Arm. Somebody said that it seemed almost as if they had one meal each day, but that occupied the whole day, for every affair planned for them included something to eat.

On the return trip, the "Cornwall" was alive with sailors waving and cheering. The passengers on the Lady Laurier returned the greeting; three cheers and a tiger were given for the British Navy, and the band aboard the excursion boat played "Rule Britannia."

Development of the Nova Scotia Steel and Coal Co., Ltd.

An article showing briefly how one of the largest steel companies in Canada grew from a little forge shop to its present gigantic proportions, and which is specially a propos in view of the recent visit of Canadian manufacturers to Halifax, a city which has participated in the growth resulting from the establishment of industries like Scotia in the Maritime Provinces.

HALIFAX may have its manufactures, but none will compare with the gigantic iron and steel industries in the north of the province, to wit, the Nova Scotia Steel and Coal Co., of New Glasgow, and the Dominion Iron and Steel Co., of Sydney. These contributed to make the Convention of the C. M. A. in Halifax, a more impressive function, without them, the subsidiary industries scattered throughout the province would be considerably crippled. To manage these plants, big men are needed, and these brought their influence to bear on the doings of the Convention.

The history of the first of these corporations is summed up in the simple facts that in 1872 it employed 10 men, whereas 6,500 are now employed. In the first year, its capital was $4,000; it is now $13,000,000. It operates its own iron ore mines in Wabana, Nfld., and exports large quantities to Europe. It owns immense collieries, operates blast and open hearth furnaces, and produces a great variety of products, from nails to huge forgings.

The Growth of Scotia.

Thirty-eight years ago the Hope Iron Works began business in New Glasgow, with a capital of four thousand dollars and eight or ten employees. Its main product was iron ship's knees. Less than four decades has seen the little forge shop expand into this big concern. In place of the primitive steam helve hammer with wooden beam, which was its first piece of equipment, the company to-day manufactures the basic elements into the most highly finished products, carries on extensive lumbering operations, and operates two lines of railway and a fleet of twenty steamers.

The development of "Scotia," as the Nova Scotia Steel and Coal Company is familiarly known, into its present important industrial position has been a steady record of perseverance and progress. It has been built up solely by Nova Scotian brains, and, to a great extent, by provincial capital, and, by its growth, has paved the way for the development of steel making in the Dominion. "Scotia" was the first company on this continent to wash coal in a commercial way, and was also the first company to make coke in retort ovens. It made the first steel ingots produced in the Dominion. It was largely responsible for the industrial development of the province by demonstrating that Cape Breton coal could be used for iron and steel making. It discovered and opened up the world-famous iron ore deposits of Wabana, and recently has again done pioneer work there by developing the submarine areas lying under Conception Bay, proving that these deposits contain hundreds of millions of tons of high class ore. Had these problems not been solved when they were, the iron and steel industry of Nova Scotia would not occupy the position it does to-day.

Much of the success that has attended the Nova Scotia Steel and Coal Company has been due to the varied nature of its product. It has three separate and independent businesses: mining iron ore, mining coal and producing iron, steel and finished steel products. This trinity of resources has resulted in the company being able to weather periods of financial depression with less inconvenience than other concerns, for experience has shown that the depressions which visit the business world in regular cycles seldom or never affect all these three industries to the same extent.

But far more important than this is the strength that the company derives from controlling all the elements that enter into the manufacture of steel. Producing its own ore, coal and limestone, and operating its own iron and steel making plants and finishing mills, it is completely independent of all other sources of supply. The operations of the company are principally conducted at three different points: Wabana, in Newfoundland, where it mines and ships iron ore; Sydney Mines, Cape Breton, where it operates five coal mines, a blast furnace, open hearth furnaces and extensive repair shops; and New Glasgow, where are located the head offices, forges and finishing mills of the company. Subsidiary lumbering operations are carried on at Gander Bay, Nfld., and Bridgeville, in Pictou county, and the company also operates an extensive limestone quarry at Point Edward, C.B.

Early History of the Company.

For six years after its foundation, the Hope Iron Works continued in business at its original location in the centre of New Glasgow. Then its name was changed to the Nova Scotia Forge Co., and the works were removed to a point two miles down the East River, then locally known as Smelt Brook, now Trenton, or North New Glasgow. In 1882 it was decided to manufacture steel, and the proprietors of the Forge Company

NEW GLASGOW PLANT, THE NOVA SCOTIA STEEL & COAL CO.

organized another company called the Nova Scotia Steel Co. This company began to make steel from imported pig iron and scrap steel by the Siemens-Martin open hearth process, and in 1883 produced the first steel ingots made in Canada. In 1889 the two companies amalgamated under the name of the Nova Scotia Steel and Forge Company.

During this time, the works had been steadily expanding. The Forge Company early began making railway car axles, and on moving to Trenton, an extensive engineering shop was installed. The first cogging mill in the Dominion was installed by the Company in 1882, and a plate mill and a 9 inch mill were added shortly afterwards. In 1891 a combined 16 inch and 9 inch mill was installed, and numerous additions and improvements have been made to this part of the company's business since.

In 1890 some of the leading shareholders in the Nova Scotia Steel and Forge Company organized the New Glasgow Iron, Coal and Railway Company with a capital of one million dollars. This company purchased extensive iron ore lands on the East River of Pictou and elsewhere, built a line of railway from Ferrona Junction on the Intercolonial to Sunny Brae, and also built a large coal washing plant, retort coke ovens and a modern blast furnace at Ferrona, seven miles from New Glasgow. The blast furnace was blown in during 1892. The coal washing plant in connection with this furnace was the first modern washer of its kind in America.

Two years later, the New Glasgow Iron, Coal and Railway Co., acquired the new famous iron ore deposits at Belle Isle, Conception Bay, Newfoundland, and added a new name, Wabana, to the list of the world's shipping ports. The mines were opened up, a double track, wire rope haulage system was built, machinery for operating it installed, storage pockets and a pier constructed, and on Christmas Day, 1895, the first shipment of Wabana ore was made by steamer. Since that time more than seven million tons of ore have been shipped, and over 1,500 steamers have loaded and discharged at this port without loss or damage of any kind or a claim being made for a farthing of insurance, a record which is believed to be unique in sea transport.

In 1895 the New Glasgow Iron, Coal and Railway Co. and the Nova Scotia Steel and Forge Co., both largely owned by the same people, were amalgamated, taking again the old name of the Nova Scotia Steel Co. Wabana ore was shipped to Pictou and used in the furnace at Ferrona with good results, and the company continued to make steady progress for a number of years. Ever in the minds of the management was the idea of an even bigger industry, a corporation which should be truly national in scope, and which should control all the basic products required for a great steel industry.

To carry out this policy, the company decided to acquire the General Mining Association's coal mines at Sydney Mines and establish an iron and steel plant at that point. Sydney Mines offered better facilities for iron making than Ferrona, for the ore could be landed there much cheaper, and the company would have its own coal supply at the furnace doors. In 1900, Mr. Thomas Cantley, the present general manager of the Nova Scotia Steel and Coal Company was sent to London with very full powers of attorney as representative of the company, and after protracted negotiations succeeded in purchasing all the vast coal areas and all the other property of the General Mining Association, securing for "Scotia" an unlimited supply of the very best quality of metallurgical coal.

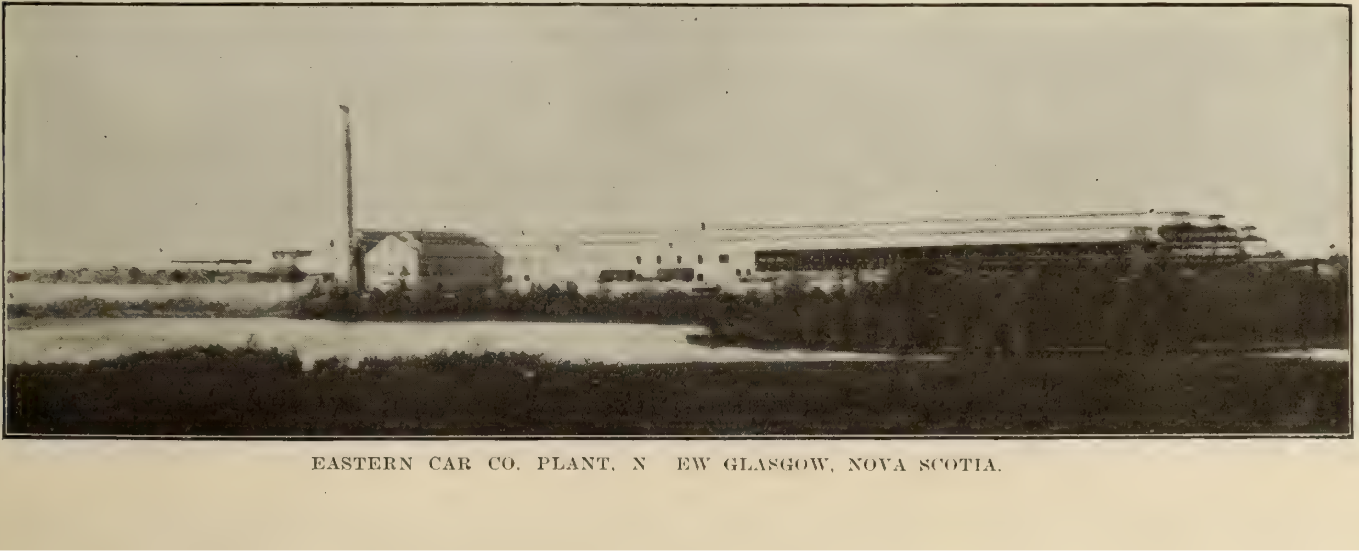
General Mining Association.

The General Mining Association was the pioneer coal mining company in Nova Scotia, and had a long and eventful history. The coal resources of the province were worked more or less spasmodically up to 1825 when Messrs. Rundall, Bridge and Rundall, of London, organized this concern. It acquired a lease of all the coal seams in the province from the Duke of York, who held a lease of all the minerals in Nova Scotia by the royal prerogative of George IV. Operations were begun shortly afterwards under the direction of Mr. Richard Brown, an eminent mining engineer and geologist who was sent out from England to manage the company's affairs, and during the seventy-five years of its existence, the company had but two general managers, Mr. Brown and his son, Mr. Richard H. Brown, who succeeded his father in 1864, and continued in the management of the company until it went out of existence.

The first shaft was sunk in 1830 at what was known as the yard pit. It was 200 feet deep. A second shaft, 320 feet deep, was sunk four years later, called the Jacob's Pit. This shaft tapped the now famous "Old Sydney" seam. In this year a railway was built from the pits to a shipping place at North Sydney. A third shaft was sunk on the Old Sydney seam in 1854 at a depth of 400 feet. In 1864, the first steam hammer used in the province was imported and erected at Sydney Mines. In the following year another colliery was opened by Hope on the Lloyd's Cove seam at Sydney Mines. The company continued making steady progress from that time on, but there were no very striking events in its history. In 1886, the first locomotive ever built in the province was constructed at Sydney Mines, and then in 1900 the G. M. A. passed into history, and in its place came the present corporation, the Nova Scotia Steel and Coal Co.

Sydney Mines Properties.

Probably the next few years witnessed the greatest expansion in the history of the company. A blast furnace of two hundred tons capacity, four open hearth furnaces, coal washer, coke ovens and extensive repair shops were erected at Sydney Mines, three more collieries



EASTERN CAR CO. PLANT. NEW GLASGOW, NOVA SCOTIA.

were sunk on the coal measures there, and the Queen pit, which had been closed some years before, was re-opened as Sydney No. 5.

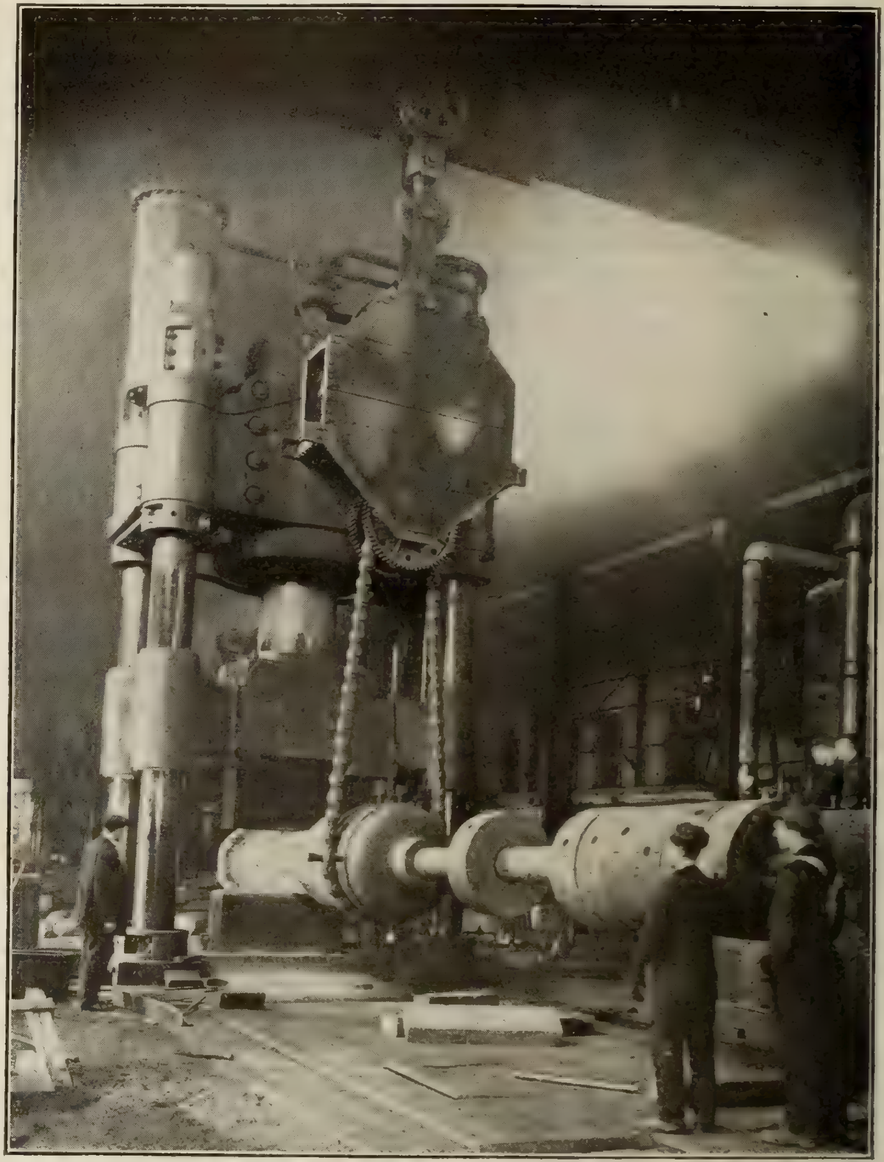
The blast furnace was blown in during September, 1904. It was designed by Messrs. F. C. Roberts & Co., Philadelphia, and is 85 feet high. There are four stoves of the Cowper type, each twelve feet in diameter and eighty-five feet high, and two blowing engines with air cylinders 72 inches in diameter, with 60 inch stroke, of the Southwark latest type, supplied with steam by Stirling water tube boilers fired with the furnace waste gases. One feature of the entire equipment at Sydney Mines is that the waste gases of the blast furnaces and coke ovens are all used for fuel, and every effort is made to reduce the consumption of coal on the plant as much as possible.

The blast furnace is fed by an inclined skip hoist supplied with coke, ore and limestone supplied by a modern storage bin system. Air at a temperature of about 1,300 degrees is forced through the furnace by two big compound blowing engines, ensuring a rapid consumption of the coke, ore and limestone to a molten mass. The iron, being heavier than the impurities contained in the mixture, sinks to the bottom of the furnace and is drawn off at intervals of three or four hours. Still in a molten condition, it is conveyed to the open hearth furnaces to be converted into steel, and the slag is then removed.

The Coke Ovens.

The coke for the furnace is produced in four batteries of coke ovens, 150 in all, of the retort type. These ovens are charged from buggies running on top, and the coke is pushed out of the ovens by electrically operated pushers. The waste gases are used to generate steam for the power plant. At the washer of No. 1 colliery, screened slack coal is washed to remove the sulphur, ash and slate.

The open hearth department consists of three 50 ton, basic furnaces of modern type and one tilting hot metal mixer with a capacity of 180 tons. In these furnaces, the iron is converted into steel by the removal of the silicon, carbon, phosporous and sulphur. Gas, at a high temperature, is drawn through the furnaces, heating the liquid contents to a much greater degree than in the blast furnace. Under this fierce heat some of the impurities in the iron are burned out, some are carried off in the gas, and the remainder are taken up by the slag. After chemical and physical tests of samples taken from the furnace show that the impurities are eliminated, the furnace is "tapped," the steel being drawn off into "ingot molds." It is allowed to cool, then the mould is removed and the ingot is ready for shipment to the mills.



4,000 TON STEAM HYDRAULIC PRESS. NOVA SCOTIA STEEL & COAL CO.

Coal Mining Machinery.

Two of the collieries, No. 1 and No. 5, are hand pick mines. In the other mines the coal is cut by machines. In No. 1, the oldest colliery, all the coal is now being extracted from submarine workings, and these workings now extend nearly two miles under the sea. These collieries are equipped with all the latest machinery and are among the most important coal producers in the province. From 2,500 to 3,000 men are employed in and about them. The number of employees in the iron and steel departments at Sydney Mines is over seven hundred, and the total yearly wage bill amounts to over two million dollars.

The Plant at New Glasgow.

All the company's crude iron and steel is now produced at Sydney Mines, the manufacturing departments, finishing mills, forges and machine shops being concentrated at New Glasgow. Employing upwards of nine hundred men, the Scotia works at New Glasgow are easily the most important industry of that town. To this point are brought the steel ingots produced at the open hearth furnaces in Sydney Mines to be converted into a great variety of finished steel products. The ingots are first re-heated in two large continuous furnaces, after which they are cogged down on a compound 26 inch reversing mill to the various sizes and shapes required for further manufacture. Then the billets pass along to the various finishing mills. There are four of these mills, consisting of one 20 inch 3-high plate mill, one 18 inch 3-high mill, and two 9 inch 3-high mills. On them are rolled plates up to 50 inches wide and from twelve B. W. G. to $\frac{3}{4}$ inches thick; mine and tram rails, from twelve to forty pounds per yard; angles from $\frac{7}{8}$ x $\frac{7}{8}$

inches to 5 x 5 inches, round bars from 5-16 inch to 4 inch; flat bars from ⅜ to 1 inch wide; fish plates, angle bars, tie plates and various shapes used by the agricultural implement manufacturers and car builders of the Dominion. A very considerable portion of the product of these mills is further manufactured at the New Glasgow works.

In the spike department are two automatic machines, capable of turning out twenty-five tons of finished railway spikes per day. Other products of the company are machinery steel, polished shafting, track bolts and nuts, boiler and structural steel rivets, etc. A new building has been erected in which the spike, bolt and nut, and polished shafting departments are located. More machinery will be added to these departments and their output very largely increased.

The Forge Shop.

At the forge shop, marine, machinery and railway forgings of iron and steel up to fifteen tons in weight are produced. The forgings are principally made from large flask ingots cast in Sydney Mines, and are brought by rail to New Glasgow. In the axle shop are the best and most modern devices for manufacturing car axles to be found in the Dominion. There are no works of the same capacity on the continent of Europe. The billets from which the axles are hammered are heated in a large continuous furnace, and are then hammered by two large upright axle hammers to the shape and size required. In connection with the New Glasgow works are large carpenter, pattern and wood working shops, also machine and structural steel shops, where a great deal of the equipment required for the company's ore and coal mines is made.

New Equipment Added.

To provide further power last year there was installed in the main power house a turbine-driven 760 k.w., a.c. generator, and an addition to the open hearth equipment was the fitting of Blair water-cooled ports to the third furnace. All are now fitted with these ports.

An important addition was made to the plant by the installation of hydraulic presses for the fluid compression of steel ingots by the Harmet patent process. This includes one group of presses of 1,200 tons, and one single ingot press of 4,000 tons. The group press can deal with four ingots at a time, and these may be either 3½ or 5 tons each, the press being fitted for either size of mold. The large 4,000 ton single press is equipped for pressing large single forging ingots weighing up to 25 tons. Both presses are fitted with hydraulic pumps and all necessary and accessory equipment.

A new Alliance ingot stripping and loading crane was installed for the stripping of ingots, and handling of ingot molds. This machine has proved to be very efficient and, combined with the fleet of ingot casting and transfer cars, has resulted in considerable economy in this development.

New Glasgow Plant.

The new cogging mill was installed during last summer, and, if called upon, can deal with a considerable increase of output.

The new forge plant at New Glasgow has been completed. This includes the erection of the new hydraulic forging plant. The output from this plant for the last three months of 1912 was greater than that of the old plant for the whole of the previous year.

The new machine roughing shop in connection with the forge plant has been equipped with four new lathes, two modern motor-driven horizontal and one vertical boring mills, a heavy Lancaster drive planer, and centering machine, etc., all electrically driven. The axle-forge and finishing shops were in full operation throughout the whole year, and from these were shipped 43,764 axles, totalling 14,127 tons in weight. To this plant there was added, during the year, one cutting-off machine and one axle-turning lathe.

Other additions to plant include, in the spike department, a new automatic spike machine with capacity of one ton of finished spikes per hour, and the installation of an electrically controlled centrifugal hydraulic pump driven by a low-pressure steam-turbine, with accessory condensing plant, etc. This pump supplies water for all high-pressure hydraulic purposes on the plant.

New Rivet and Bolt Plant.

Progress has been made with the new rivet, bolt and nut plant, which includes all the necessary machines for the manufacture of rivets for boiler and structural work, track and machine bolts, and a large range of square and hexagon nuts. The several machines and heating furnaces are located on an elevated ferro-concrete platform in the manufacturing building; openings in the platform permit the rivets, bolts and nuts as they are forged, to drop to the floor underneath, where, after cooling, they are treated, tapped, or otherwise finished for shipment on cars on the adjacent railway siding.

For general repair work to this plant, as well as for the making of dies, a machine shop was outfitted, and is located in the same building. Its equipment includes the necessary lathes, grinding machines, cold saws, drill presses, milling machines, etc., each of which are operated by individual motor drive. A portion of this building is also used as a smith shop, with apparatus for all small forging and annealing work required in conjunction with this class of work.

Eastern Car Company.

During last summer the Eastern Car Co., Ltd., was organised, being a subsidiary company for the manufacture of steel railway cars. The plant of the Car Company is situated on a plot of 68 acres, adjoining the mills and plant of the Nova Scotia Steel and Coal Co., Ltd., at New Glasgow, having on one side the tracks of Intercolonial Railway, and on the other the tidal waters of Pictou Harbor. The plant is now in operation. The Car Company is a large user of the finished products of the Nova Scotia Steel and Coal Co.

Output and Wages.

The total quantity of ore mined at Wabana last year was 555,000 tons, while of coal the total quantity mined was 841,528 tons, an increase of more than 60,000 odd tons over the previous year. The other outputs were:—

	Tons.
Coke made	85,334
Limestone and dolomite quarried	66,315
Pig iron made	68,784
Steel ingots made at Sydney Mines	77,940
Steel billets rolled at New Glasgow	71,284
Total shipments of finished steel forgings, etc., from New Glasgow works	77,037

For the year 1912 the sum of $3,188,569.87 was paid in wages, distributed as follows:—

For labour in connection with mines and collieries	$2,006,689.30
Iron, steel and coke departments, Sydney mines	515,233.30
At New Glasgow Works ..	666,647.27

The average number of men employed throughout the year was over 5,600, there being employed:

At Sydney Mines Collieries	2,701
At Iron and Steel Department, Sydney Mines	910
At New Glasgow	1,084
At Wabana	951

The total amount expended on capital account during the year at Wabana, Sydney Mines, New Glasgow, and elsewhere, was $1,279,569.00.

The offices are:—Mr. R. E. Harris, K.C., president; Hon. J. D. MacGregor, first vice-president; Thomas Cantley, second vice-president, with R. E. Harris, K.C.; J. D. MacGregor, R. E. Chambers, G. F. McKay, Jas. C. MacGregor, and Thomas Cantley, Executive Committee.

INTERCOLONIAL RAILWAY REORGANIZATION.

A GENERAL reorganization of the Intercolonial Railway was announced by Mr. F. P. Gutelius, general manager of the Government railway system, in a recent interview. The programme will include the creation of two new departments, the double tracking of several sections of the road, increasing yard and shop facilities at several points, improved ferry service at the Strait of Canso, installation of a telephone despatching system on the St. John-Moncton section, when the automatic block system will also be introduced, and a general overhauling of station property, as well as the construction of several new and attractive station houses, including one at Truro which will rank among the finest in the Dominion.

The New Departments.

In connection with the two new departments which are being created, the names of the officials were also announced. Mr. Robert Simpson has been appointed general fuel agent, and Mr. B. K. Kluck becomes general tie agent. The creation of these departments is expected to bring a greater degree of efficiency to the general system, the new men being experienced in the work for which they have been chosen. Mr. Kluck, the new tie inspector, has occupied a like position at St. John, N.B., for the C.P.R. for over three years.

Mr. Robert Simpson, the newly appointed general fuel agent, who has been on the I.C.R. for the past twenty years, is a graduate of the Royal Military College, and was special engineer for Mr. David Pottinger for many years. The work of these two positions was formerly scattered over several departments and a great improvement is looked for in the new system, which comes into effect in a few days.

Speaking particularly of the fuel department, Mr. Gutelius stated that they were now paying from forty to fifty cents more a ton for their coal than eighteen months ago. The value of the appointment of a fuel superintendent, he said, would be in the fact that a closer inspection would be possible, assuring a better grade of coal and more economical handling. He also felt that the advantages to be derived from the appointment of a general tie agent would be about the same, as in future ties will be delivered where they are required and in the quantity required.

Look After Own Repairs.

As regards the reorganization now going on along the line of shops, the general manager said that when all the shops were fully manned they would have a sufficient force to look after repairs of cars and locomotives. They had now about a thousand men at work in the Moncton shops, but it had been concluded that it did not pay to make an absolute concentration of the system's mechanical force at headquarters. They had shops at Chaudiere Junction, at River du Loup, at Stellarton and at Halifax, where repairs could be carried on with economy and despatch. In fact, he said, they had put on fifty additional men at River du Loup quite recently, but of course all the boiler repairs had yet to be done at Moncton.

Double-tracking Contract.

The additional double tracking of the line was going forward at congested points. The general manager stated that a contract had been given out to Soper & McDougall for the double tracking of eight miles of road from Levis to Chaudiere Junction, while the yards at Levis were also to be extended to about double their present size.

Another step forward was being taken down east in order to secure quicker transportation across the Strait of Canso. Canadian shipbuilders had been asked to tender on a second ferry boat for the Canso crossing, the expenditure on this alone amounting to about $300,000. The old ferry, he said, had done splendid service, but a duplicate boat was necessary, and this would, it was hoped, be secured in the near future.

Train Dispatching.

An important feature, according to Mr. Gutelius, will be the train dispatching of the St. John and Moncton section by telephone, tenders now being invited for two copper wires with telephones in the dispatcher's office and in each station along the line between the points mentioned. This will be the first attempt at train dispatching by telephone on the Government System, but the results obtained by Mr. Gutelius on the Lake Superior section of the C.P.R. convinced him that a like system will be successful on the I.C.R. The automatic block system would, he said, be introduced at the same time.

New Stations.

The stations along the I.C.R. are also, he says, being generally overhauled, while very fine structures are being built at Bathurst and Sussex in New Brunswick, and at Truro in Nova Scotia. The last named will be one of the finest station buildings in the Dominion.

The grade revision of the entire system, as promised when Mr. Gutelius took charge of the road, will be started on the Cape Breton section of the road as soon as authority for the expenditure will have been obtained from Parliament, while the surveys are about completed for the change between River du Loup and St. Flavie where the grades are heavy. Engineers are, in fact, going over the whole system, and in good time better grades and curves will be secured.

Traffic in both passenger and freight department, says Mr. Gutelius, is very heavy and constantly on the increase.

◆

BONUSING INDUSTRIES.

AT one of the sessions of the Convention of the Associated Boards of Trade of Western Canada, which met recently at Winnipeg, the bonusing of industries was lengthily and heatedly discussed. The discussion was on a resolution of Mr. D. Y. Leslie, Swift Current, Sask., to the effect that the time had come when legislative restrictions upon the bonusing of industries in the West should be enforced and supplemented. In introducing the motion, Mr. Leslie gave a number of instances of the abuses of the bonusing method, and stated that the practice was becoming so serious as to jeopardize the future of cities and towns concerned.

Favor Bonusing.

Representatives from Fort William, Medicine Hat and Prince Albert opposed the resolution, and endeavored to show that the system could be made a sound and paying investment. Mr. W. B. Wilcox, of Medicine Hat, said that that city had granted in concessions to industries, during the last eighteen months, 137 acres of land, which, with all other concessions, had cost $150,000. These industries, when completed, and in full running order, in accordance with the contracts signed with the city, would employ 1,850 men.

Experience had shown them in the natural gas department of Medicine Hat that in selling gas for domestic purposes at 13½ cents per thousand, and at 5 cents for manufacturing purposes, the city realizes a net revenue of $5 per annum for each head of population, and this increase, due to the coming of the industries spoken of, meant $50,000 per annum, or that the total cost to the city would be paid back in gas revenue alone every three years. The resolution was lost.

◆

LIQUID ALUMINUM.

ACCORDING to German journals, experiments made to bring aluminum to a liquid condition, so that it may be spread when cold over any dry surface, have been successful. The composition is applied like paint with a brush, and looks, when spread, like a dull silver coating. It is said to be an excellent preventive of rust, to be resistant to heat, elastic, durable, and resistant to atmospheric influences, and to form an excellent substitute for tin in plating.

THE C.M.A. CONVENTION AT HALIFAX, N.S.

THE editorial pages in this issue of Canadian Machinery have been given over to a more than usually extended account of the Canadian Manufacturers' Association Annual Convention, held last week in Halifax, Nova Scotia Province. Opportunity has been taken at the same time to bring to the notice of our readers, a number of features relative to the growth and development of Canada's Maritime Provinces generally, and, while in the space at our disposal, much necessarily important and at the same time equally interesting material in the up-to-date record of industrial achievement which these eastern sections of our Dominion have accomplished and are doggedly persevering to surpass, has had to be unwillingly omitted, sufficient, we feel appears to whet the desire to learn more of the Maritime Provinces' possibilities, and to, may be, help foster and encourage a more popular movement in their favor.

The Convention proceedings, as has been already stated, are fully chronicled, and one cannot help feeling enthused with the optimism expressed and which generally prevailed, regarding the future of this Dominion. We may not all see eye to eye in the determination of the legislation which shall best fit the exigencies arising from the upbuilding and populating of a nationality such as Canada is striving towards to-day, yet we can at least exercise that tolerance, and render that assistance towards those who, we feel, are striving to attain that end by honesty of purpose and consideration for the welfare of each and all.

❖

GOVERNMENT RETARDS TECHNICAL EDUCATION.

AT a time when the Dominion Government is professedly legislating for the encouragement of technical education in Canada, when a Royal Commission has just made its report, urging that something be done quickly to save this country from lagging behind, it is ironical that the Department of Customs should be doing something which has the effect of hampering the work of those cities which, by their own enterprise, have built technical schools that will easily compare with those in Great Britain, the United States and Germany. It is because of the desire of these cities to have their technical schools equipped with twentieth century machinery that they must suffer. Had they been content to train budding mechanics in the manipulation of antiquated machines, everything would have been serene, and technical education in Canada would have been retarded just that much. Let us state the facts:

The Finance Committee of the Toronto Board of Education called tenders for the supply of modern machine tools and woodworking machinery. Specifications were submitted by several prominent Toronto brokers, and the contracts awarded to those whose tenders were found most satisfactory. It so happened that several machines ordered were of foreign manufacture, and tenders were submitted on the assumption that such machinery would be allowed to enter the country free, under the heading of "philosophical apparatus." A hitch has arisen through the fact that the Department of Customs has ceased to allow machinery for educational purposes to enter the country free. The lathes, etc., are required in the school to allow work to proceed. They lie in bond, with $700 duty owing. The brokers who received the order will not pay the duty or they will be selling at a loss, so they have asked the Board of Education to assist them. Accordingly, Dr. McKay, Principal of the Toronto Technical School, has written to the Minister of Customs for an explanation.

The point is that, for many years, machinery for educational purposes has been non-dutiable. A college requiring a microscope for scientific purposes, gets it imported cheaply. How much more important then is it that the technical schools of Canada should be allowed to get their lathes, drill presses, etc., as cheaply as possible! The good work of technical education, on which the Government has liberally spent thousands of dollars simply to gain information, is being held up by a levy of $700 placed on it by the Government itself. There must surely be a misunderstanding.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, September 22, 1913.—Though a general feeling of optimism pervades the air, it would be too much to say that business in the machinery trade is brisk at present. During the past week no special improvement has taken place in the situation. Orders for the equipment of the new Edmonton Technical School have been placed, but on a much reduced scale compared with the original enquiries. The tightness of money in the West, now happily passing away, is given as the reason for the reduction. Probably the present purchases will be supplemented by further equipment when financial conditions are more satisfactory. The local machinery houses are busily engaged on several enquiries recently received, and it is probable that there may be more interesting matter to report next week.

Business with the various local bridge-building and structural steel concerns is very brisk just now. The Dominion Bridge Co. is having difficulty in keeping up with its orders, and the Phoenix Bridge & Iron Works is said to have enough work on hand to keep it busy for the next six months. The latter firm is working overtime three nights a week in an endeavor to overtake orders.

Pig Iron, Copper, Etc.

There is little to report this week in regard to these markets. While several nice enquiries have been received for fair-sized lots of English pig iron, few actual orders have been booked and, these have ranged on the small side. This condition of affairs, however, is probably only temporary, and the immediate future is likely to see a resumption of brisk buying in anticipation of the end of navigation for the year.

Copper of all grades shows a fractional advance over last week's prices, but this market is very dull at present, only a few small lots having changed hands. Tin is a shade easier and lead remains unchanged. The supply of the latter for prompt delivery is very small.

The Montreal Trust Co. and Mr. Edgar McDougall have now been appointed joint liquidators of the Canada Iron Corporation. The former will look after the technical end of the liquidation, while Mr. McDougall will supervise the carrying on of the business during the liquidation. A meeting of the bondholders to discuss the plans now being worked out for the re-organization of the company is expected to be held within the next few weeks.

Toronto, Ont., Sept. 23, 1913.—Warehouse prices of steel are unchanged. There is marked activity in mill buying, due to the reluctance of manufacturers to buy other than absolute needs to carry them over the prevailing stiff market. The resultant activity on the part of the sellers has resulted in healthy competition, sometimes to the benefit of consumers. As stated last week, the prices of steel may be expected to be affected thereby. The situation is peculiar. One mill has all its orders for structural steel filled, and due to shortsightedness, is now without orders for this commodity. Thus, it has structural steel on its hands, whereas the same mill cannot deliver plates for months. On the other hand, its strongest competitor is in excellent shape, where the other is weak, and vice versa. This condition obtains in five or six different plants, both here and in the United States. A careful buyer might, therefore, replenish his stocks just now to excellent advantage.

The opinion is expressed on every hand that business will not revive again until the spring. Men who are as a rule reticent on this subject frankly give this as their opinion. The quietness in the building trade partly contributes to this condition. The farmers in the West will not be buying machinery until the spring, so that implement manufacturers will find business dull this winter. Steel makers expect a big volume of business in January. The pig iron market is firm, and prices have advanced both here and in the States. The Steel Co. of Canada is selling foundry pig at from $18.75 to $19, an advance of about a dollar.

Machine Tools.

Machine tool dealers declare that their business is better. A considerable portion of the order for machine tools to equip the new plant of the Union Carbide Co., at Welland, went to John Bertram & Sons, Dundas, Ont.

Metals.

The Canadian trade for metals is bad; the English trade is fair. Dealers report no changes in price. The market is steady, and business here is being done only in staple lines.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Fort William.—The Superior Rolling Mills Co., Ltd., has deposited at Ottawa plans and description of its proposed wharf at Fort William, Ont.

Sarnia, Ont.—The Cleveland Foundry Co.'s new plant here will consist of three buildings measuring 200 x 100 feet. 250 men will be employed within a year.

Medicine Hat, Alta.—On Sept. 9 the ratepayers passed by-laws granting concessions to the Medicine Hat Brick Co., and the Western Canada Threshing Machine Co.

St. Boniface, Man. — It is reported that the William Galloway Co., will establish an agricultural implement factory in the near future at St. Boniface, Man., across the river from Winnipeg.

Toronto, Ont.—The Bawden Machine Co. have applied to the Board of Control for a permit to erect a cupola and foundry at 107 Sterling Road, where their new plant is located. The permit will probably be granted.

Hamilton, Ont.—The Sawyer-Massey Co. have taken out building permits for a new foundry building to be erected on Wellington Street North at a cost of $5,000, and the Grazelli Chemical Company for three new buildings on Ottawa Street to cost $5,000.

Lethbridge, Alta. — The Lethbridge Brewing and Malting Co. and the Ellison Milling Co. are doubling the capacity of their plants. The Lethbridge Iron Works, Niven Bros.' Brass Foundry and the Southern Alberta Welding Co. are adding new equipment.

Windsor, Ont.—The Swedish Crucible Steel Co., Hamtramck, Mich., a suburb of Detroit, manufacturers of the Olson tool steel plow point, will require for installation in its new plant now under construction at Windsor, Ont., a crane (either three or five-ton), direct-connected emery wheels, facing mills, tumbling mills, core and annealing ovens and a sand blast apparatus.

Chatham, Ont.—The Chatham Manufacturing Company has been organized and the following officers elected: President, W. H. Westman, Chatham; vice-president, H. W. Brown, Lansing, Mich.; secretary-treasurer and general manager, A. D. Westman. The company has taken over the entire business of the Chatham Malleable and Steel Manufacturing Co., and will build a large addition to the local plant in the near future.

Hamilton, Ont.—The Canadian Westinghouse Co., has decided to erect a new foundry building on Aberdeen avenue in the vicinity of the golf links at a cost of about $150,000. The contract has already been awarded to H. G. Christman and Son. The company, it was said, had secured sufficient land for further extensions when necessary. The new building will be of reinforced concrete construction, and work will be started immediately.

N. T. R. QUEBEC SHOPS.

Mayor Drouin, Quebec, received a telegram from Major Leonard of the Transcontinental Railway Commission that the contract for the construction of the workshops of the N. T. R. at St. Malo had been awarded to Contractor Gosselin, of Levis, and that the contract had been signed on the morning of September 16. The cost of the work, which is to be started immediately, will be $1,500,000.

Electrical

South Vancouver, B.C.—This town will probably spend $600,000 on a municipal electric plant.

Stratford, Ont.—The city has discontinued the use of electricity for the water pumps owing to increased Hydro-Electric charges.

Kingston, Ont.—It is likely that the City Council will again ask Hon. Adam Beck what he can give Kingston in the way of hydro power, now that it is proposed to generate current at the High Falls on the Madawaska River.

Fort William, Ont.—There are strong indications that the Hydro Electric Commission of Ontario, is prepared to go through with a scheme to put in a plant for the manufacture of hydro-electric power at Dog Lake. The indications are further substantiated by the arrival in this city of hydro-electric inspector Hogg, of Toronto, with four assistant engineers, who left for Dog Lake.

South Vancouver.—A resolution in favor of the establishment of a municipal electric plant has been passed by the Council. It is the direct result of a report by the municipal electrician to the effect that for an initial cost of $600,000 an electric power and light plant could be established capable of serving the district for the next five years. It is estimated that electricity for lighting purposes could be supplied at seven cents per kilowatt hour, and for power purposes at two cents per kilowatt on the day load, and the plant still be revenue-producing. Crude oil for the generating plant is advised. The question of the desirability of a municipal gas plant is also under consideration.

General Industrial

New Westminster, B.C.—The Vancouver Milling and Grain Co., Ltd., will build elevators on Front Street.

Thorold, Ont.—The new plant of the Ontario Pulp Co., erected at a cost of about $1,000,000, was placed in operation September 11.

St. John, N.B.—Mechanical coal punches have been installed in the Tothwell Coal Co. mines at Minto, and others will be purchased later.

Smith's Falls, Ont.—The Lewis Medicine Co., on Water street, of which Mr. H. E. Smith, is manager, is installing machinery in its premises to manufacture its medicines here in future.

Toronto, Ont.—The Canadian Mineral Rubber Co. was wound up on an order granted at Osgoode Hall, Sept. 19. The company was incorporated in 1909 with a capital stock of $1,500,000.

Vancouver, B.C. — Negotiations are proceeding for the establishment of a factory by the Kelly Springfield Tire Co. on the north arm of the Fraser River, near Main Street, which, it is anticipated, will have a payroll of $20,000 a month.

Medicine Hat, Alta.—From a letter read at the meeting of the City Council September 15, it would appear that it will not be long before work is started on the erection of the Maple Leaf Mills

The Man Who Begins Is The Man Who Wins

¶ Some day I will, but not just yet!'' That's hesitation and an admission of inability to make a decision.

¶ Hesitation always did come expensive and it costs more to-day than it has since it used to cost men their heads in the strenuous times of old. Hesitation is a phantom barrier across the highway of success, and to force the obstruction is to dispel it with its attendant doubts and forebodings.

¶ The men who WIN are the men who BEGIN.

¶ The most successful and best known concerns some time or other made the move that eventually put them on top. They made the decision that started them on the way to success. They might have hesitated for years without advertising. They might have said:

¶ ''Yes, we intend to advertise but not just yet!''

¶ But they said instead:

¶ ''If we're going to advertise at all we'd better start right now. If advertising is going to do all we fully expect it will, NOW is the time to start. We can commence right away just as well as next year—let's go to it NOW!''

¶ There are some men, too, who make the decision to advertise and work it for all it is worth for a few months and then they come to the old familiar will-o-the-wisp bogey—hesitation. ''Will we go ahead—is it paying us—had we better try some other scheme for a while?''

¶ Sticking to a decision is no less important than making one. Cold feet bring nothing but discomfort. If a decision isn't worthy sticking to, why make it?

¶ John Wanamaker says that advertising doesn't jerk—it PULLS. He ought to know, and yet some men think that advertising should go against all rules and precedents and jerk them to success with one tremendous yank.

¶ One of the biggest men in the engineering business said to us last week as he renewed his contracts:

¶ ''For seven years we have not known what it is to want an order. We have always been busy.''

¶ Some time ago, away back nine or ten years, a decision was made and the resultant policy has been closely followed to a big success.

¶ Get out of that habit of hesitating. Its costs you a heap sight more than you think it saves you.

Rate Card and full information gladly furnished

Canadian Machinery & Manufacturing News

Canada's only Machinery and Metal Working Paper.
A weekly publication that thoroughly covers its Field.

143 University Avenue, TORONTO

here. The letter was from H. G. Shaw, general manager of the Company.

New Westminister, B.C.—Exhaustive data concerning the entire property of the Westminster Gas Co., are being compiled for submission to Mr. H. N. Pabst, Portland, Ore., consulting gas engineer, who was chosen as the city's adviser in connection with the proposed municipal gas plant.

Creston, B.C. — A canning establishment for the Creston district is now assured. David Timmins and associates have already commenced operations on a plant, and a Winnipeg wholesale house has already begun negotiations for the entire output of the factory.

Moose Jaw, Sask.—A fire at Milestone totally destroyed the International elevator and a private elevator owned by O. K. Wilson, Milestone. The loss to the International Elevator Co., is 20,000 bushels of grain, fully insured, while Wilson lost 25,000 bushels of grain with $15,000 insurance.

Medicine Hat, Alta. — An agreement has been signed between the City Council of Medicine Hat, Alberta, and the Dominion Sanitary Fountain Co., capitalized at $100,000, by which the latter agrees to erect a plant valued at $15,000. The company has a factory in Spokane and other cities in the United States.

Shawinigan Falls, Que. — The Belgo-Canadian Pulp & Paper Co., Shawinigan Falls, Que., will erect a sulphite mill of a capacity of 50 tons per day per 24 hour, with necessary buildings so as to permit of an extension of output to 100 tons. The company is also planning an extension to the paper mill, which will be completed about the end of next year.

Calgary, Alta.—A syndicate of local and Minneapolis capitalists, of which G. G. Devonish is the head, will shortly commence the erection of a large flour mill at Calgary, Alberta. The mill will be built in four units to cost $1,400,000 each, and, when all are completed, will have a capacity of 6,000 barrels of flour per day. Work on the first unit will be commenced immediately.

Contracts Awarded

Victoria, B.C. — Albert Kelley, of Seattle, has been awarded a contract by the Pelton Water Wheel Co., for two miles of welded steel pressure pipe from 48 to 54 inches in diameter, for the hydro-electric plant at the Jordan river.

Victoria, B.C.— Excavation work on the site of the new Hudson's Bay department store in the city of Victoria, has been commenced by Messrs. Luney Brothers, who have been awarded the contract for this work.

Medicine Hat, Alta.—The city will build a large addition to its power plant and instal generators to furnish 2,500 k.w. at a cost of $250,000. A new plant now being erected has a capacity of 1,500 k.w., which is all spoken for.

Port Arthur, Ont.—The Western Drydock and Shipbuilding Co., have been awarded the contract to repair the two C.P.R. steamers Alberta and Athabasca. Both steamers are to be completely fitted out with new boilers and accessories, and undergo other general repairs. It is stated that the cost of the work of improvements when completed, will amount to considerably over $65,000.

Marine

Vancouver, B.C.—H. H. Stevens, M. P., has confirmed the statement that the Federal Government is negotiating with an engineering company for the construction of drydocks at Vancouver larger than any drydock now in service on the North Pacific coast.

Toronto, Ont.—The plant will be built, and everything ready for the improvements to the Toronto harbor at the opening of the season next spring, according to W. T. Stewart, president of the Canadian Stewart Company. Contracts amounting to $11,000,000 have been awarded his company for the work. Four high power sand dredges, several bucket dredges, about six pile drivers, a fleet of scows, tugs, and big barges will compose the plant. The whole of it will be built in Canada, and as much as possible in Toronto.

New Incorporations

Bosch Magneto Co., Ltd., incorporated at Ottawa, capital $25,000, to manufacture machinery, etc., at Toronto. Incorporators: Frederick D. Norman, Walter J. Boland, etc., Toronto.

L'Original Stave and Lumber Mfg. Co., Ltd., incorporated at Ottawa, capital $145,000, to manufacture staves, etc., at L'Original, Ont. Incorporators: Thibaudeau Rinfret, Joseph E. Billette, Livens, etc., Detroit.

Kas-so Kitch-e-mon-e-too So-ne-ah, Ltd., incorporated at Ottawa, capital $50,000, to manufacture building materials, etc., at Montreal. Incorporators: John E. Bulmer, William G. Taylor, etc., Montreal.

The Union Electro-Products Co., Ltd., incorporated at Ottawa, capital $40,000, to manufacture and sell electric cooking and heating utensils, at Windsor, Ont. Incorporators: Mae Livens, Harry N. A.

Canadian Krantz Electrical and Manufacturing Co., Ltd., incorporated at Toronto, capital $160,000, to manufacture electric supplies, fittings, etc., at Toronto. Incorporators: William N. Ferguson, Harcourt Ferguson, etc., of Toronto.

Building Notes

Toronto, Ont.—Toronto is to have another sky-scraper, which will be built by a large Montreal financial institution, on West King street. The property takes in 105 feet, immediately east of the Woodbine Hotel, from numbers 90 to 98.

Toronto, Ont.—Construction work on the new seven-storey C.P.R. office building on the southeast corner of King and Simcoe streets, has been started. The permit for the erection of the structure, at a cost of $250,000, was issued yesterday and the P. W. Lyall Co., contractors, have started excavation work. The new building will be used for freight offices only.

Railways—Bridges

Hamilton.—A bridge to cost $100,000 is being planned by the McKittrick syndicate to be built to connect the southwestern portion of the city with the real estate owned by the syndicate.

London, Ont.—At the meeting of the City Council held last week, it was decided to submit a by-law to the ratepayers to expend $700,000 on the electrification of the London and Port Stanley Railway.

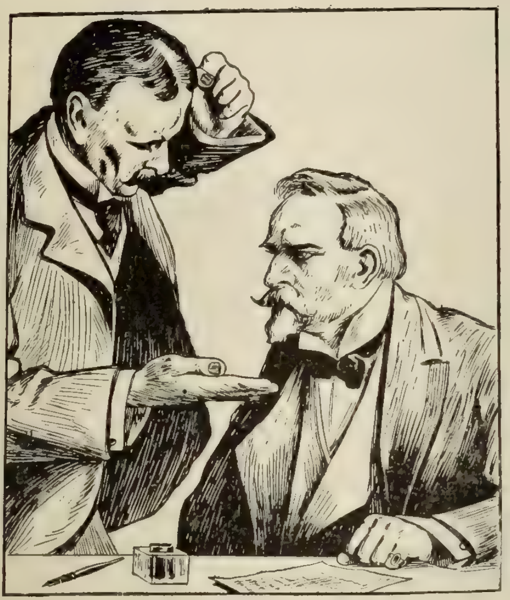
Humboldt, Sask.—An order becomes effective on October 15 for the removal to Humboldt from North Battleford of the C.N.R. shops. This means the removal of 200 railway men and the construction of ten more stalls at the round house.

Hanover, Ont.—The erection of the new iron bridge at John Hudson's, Bentwick Township, has been begun. Joseph Cope, of Chesley, is the contractor for the cement work, while the Corbett Company, of Owen Sound, are looking after the ironwork.

Wood-Working

Dryden, Ont.—The Rock Lake Lumber Co., had a big fire last week, destroying the planing mill.

You Are Paying Nearly 80% More For Fire Insurance Than Is Necessary



If Your Plant Is Not Sprinkler Protected.

Manufacturers' Automatic Sprinklers

will pay for their installation in from three to five years in the saving of insurance premiums. **They must protect** or the insurance company would not endorse them as they do.

Can be installed in existing plants without interruption to work.

The Way to the Job Higher Up

The manager of the largest concern of its kind in Canada recently gave our circulation representative a pass and permission to interview members of their mechanical staff.

This was done because the manager realized that the man who reads his technical paper is more efficient than the man who doesn't.

And the efficient man is the best paid, the most ambitious, and in the end is found at the top of the ladder.

Study your paper carefully and apply the knowledge in your daily work. Keep your subscription renewed so that you will not miss one issue.

The date on the label of your wrapper shows when your subscription expires. **Less than four cents per copy**—two dollars a year—will renew it. Do it promptly in your own interest.

Elko, B.C.—Leask & Johnson are moving their planing mill to Fort Steele.

Quebec.— Turner's pulp and lumber mills, including the box shed and dynamo, at Lake Edward, were completely destroyed by fire Sept. 18. The loss is estimated at $17,000 and is covered by insurance. The property is owned by Hon. Richard Turner of this city.

Trade Gossip

U.S. Steel Co. in Manitoba.—The United States Steel Corporation Products Co., a New Jersey Corporation, has applied for permission to do business in Manitoba. While the application does not so state, it is believed this organization is the selling corporation of the United States Steel Trust.

The Canadian Furnace Co., manufacturers of pig iron, will light their new furnace at Port Colborne, Ont., on Saturday, Sept. 27. The plant itself is entirely completed, though the dock and dock machinery are not. Luncheon will be served on the steamer Mojeska at 12 o'clock, noon. A special train will be run from Buffalo. Following the ceremony, the party will be taken up the Welland Canal to Thorold on the above steamer. M. A. Hanna & Co., Cleveland, Ohio, are exclusive sales agents for the Canadian Furnace Co.

Personal

Professor J. N. Finlayson, lately appointed to the Chair of Engineering at Dalhousie University, has arrived in Halifax from Vancouver.

James Ross, a prominent citizen of Montreal, and of high reputation as a railroad builder, died at his residence there, on Saturday morning, September 20. He was 65 years of age.

Ex-Ald. George W. Armstrong died in London, Ont., last Sunday. Until a few years ago he was head of the London Brass Works. Mr. Armstrong came from Manchester, Eng.

H. T. Meldrum, has been appointed secretary of the Canadian Pulp and Paper Association, the duties in connection with which he will take over at once. Mr. Meldrum is a graduate of McGill University and of the newspaper business, having been a reporter on the Montreal dailies. He has a broad knowledge of the paper and pulp industry, having been for two sessions in close touch with leaders of the industry when a Parliamentary reporter.

A HANDY SOUVENIR.

THE Canada Grip Nut Co., Ltd., Montreal, are distributing among their clients an extremely useful case of "first aid" appliances. The box, which has an attractive appearance, measures only 6½ x 3 x 2 inches, yet it contains quite an assortment of high grade bandages, drugs in compressed form, cotton wool, etc. It is a thoroughly practical outfit, and is put up by one of the largest firms of wholesale druggists in Great Britain. The box is handsomely finished in dark blue enamel, and bears on the front the words—"Grip Nuts prevent accidents." Inside the lid is a postal card, which the fortunate possessor of this first aid outfit has only to mail to the Canada Grip Nut Company to obtain a complete refill for the case.

◆

Miscellaneous

The Nova Scotia Steel & Coal Co., New Glasgow, N.S., are installing nine 316 h.p. Fulton water-cooled mechanical stokers, which are being supplied and erected by the Hare Engineering Co., Toronto. The Canadian Locomotive Co. of Kingston, Ont., are changing over from oil furnaces to stoker fired furnaces as a result of their investigating the relative economy of coal fired and fuel oil fired boilers. This equipment is also being supplied by the Hare Engineering Co. The Montreal Rolling Mills Co., a branch of the Steel Company of Canada, are installing a Fulton stoker-fired furnace in their nut and bolt plant. This is a fifth or sixth repeat order.

Railroad Electrification.—If we bear in mind the many difficult problems and the great cost involved in changing from steam to electric operation on railways, it must be admitted that great strides have been made in this direction. A recent estimate places the total number of miles of single track that have been changed from steam to electric operation in the United States at about 1,600 miles, and the same authority finds that approximately 1,500 miles of single railway track will probably be subjected to the same change during the next few years.

Pigeon, Pigeon, & Davis, patent solicitors, 714 St. James Street, Montreal, report that 94 Canadian patents were issued during the week ending August 26th, 1913, of which 64 were granted to Americans, 18 to Canadians, 8 to residents of Great Britain and Colonies, and 4 to residents of Foreign Countries. Of the Canadians who received patents, 7 were residents of Quebec, 7 of Ontario, 2 of Manitoba, and 2 of British Columbia. In the United States, for the same week, 666 patents were issued, of which 10 were granted to Canadian inventors.

Catalogues

The Steel Co., of Canada, Ltd., Hamilton, require a building catalogue to embody prices and descriptions of everything they manufacture. Their general catalogue for 1913 is just out, and is a veritable text-book.

Protection of Iron & Steel against Corrosion is the title of a pamphlet which has been issued by the Metal Treating & Equipment Co., New York. The pamphlet gives a description of the "Standard" galvanizing process, and also contains a lot of interesting information on galvanizing and corrosion.

The "Thor" Air Tools are described in a comprehensive manner in circular S which we have received from the Independent Pneumatic Tool Co., Chicago. Several types are illustrated and capacities given for the various kinds of work for which they are adapted; also a general specification for the different sizes.

Series Luminous Arc Lamps are described in bulletin No. A-4035 published by the Canadian General Electric Company, Toronto. A full description is given of the lamp and photographs of streets where they are installed, demonstrating their illuminating capacity. Some illumination curves are also included.

"**Unilets**" is the title of a pamphlet being distributed by Chapman & Walker, Toronto, and which describes a line of steel fittings for electrical conduit work. Each type and size of the "Unilets" fitting is illustrated and numbered so that orders may be placed without difficulty. Copies may be had on application.

"**Curtis Steam Turbines**" is the title of a handsome bulletin which the Can. General Electric Co. have sent us. The bulletin contains a general description of the Curtis turbine together with excellent photographs of several installations and also of details showing some special features of construction. Copies of this bulletin No. A-4137 may be had by writing.

"**Electricity on the New York Central**" is the title of an interesting booklet published by the Can. General Electric Co., Ltd., Toronto. This booklet contains a brief description of the new terminals of the New York Central Ry.

Not an Enterprise for the "Quitter"

¶ "If there is one enterprise on earth," says John Wanamaker, "that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick like a barnacle on a boat's bottom.

¶ "He must know before he begins it that he must spend money—lots of it.

¶ "Somebody must tell him that he cannot hope to reap results commensurate with his expenditure early in the game.

¶ "Advertising does not jerk; it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year, until it exerts an irresistible power."

in New York and also particulars of the trains, power plants, substations, illumination, etc. Some excellent photographs are included showing the above.

The Can. General Electric Co., Ltd., Toronto, have issued bulletin No. A4130 describing their adjustable speed direct current motors. The principal features of this type of motor are fully described and illustrations are shown of machine tools equipped with it. The bulletin also contains several diagrams showing curves and ratings for the various sizes. Copies will be gladly sent to interested readers.

Hamilton, Its History, Commerce, Industries and Resources, is the title of a handbook isued under the auspices of the city council in the Centennial Year, 1913, a copy of which is in our hands. Suffice it to say that this work is bound and printed in the excellent way that is characteristic of most publicity literature sent out by this city. As a history of Hamilton there has not been anything like it published heretofore.

The Bawden Machine Co., Ltd., Toronto, have sent us a copy of their new catalog No. 10 describing the well-known "Bawden" simplex steam pump which they manufacture. The special features embodied in the design of this pump are fully described together with diagrams showing the patent operating valve. Tables are included giving the principal dimensions, capacities, code words, etc., for each type and size. This is a handsome catalog, the reading matter being in good type and illustrations clear. Copies will be gladly sent on request.

The Morris Machine Works, Baldwinsville, N.Y. have issued a handsome catalog describing the line of centrifugal pumps which they manufacture. An interesting feature of this catalog is the section devoted to the design and characteristics of centrifugal pumps which also includes several efficiency curves. Many illustrations are given, showing their pumps driven by various types of motive power, also several tables giving the principle dimensions, capacities, etc., for each type and size. The Storey Pump & Equipment Co., Toronto, are the Canadian agents for this firm and will be glad to send copies to interested readers.

$\frac{1}{16}$ **Page** $1.60 per insertion on yearly order.

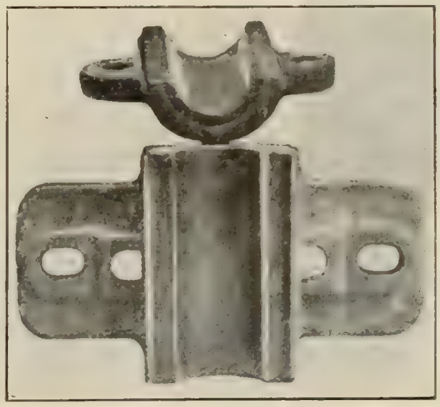
GRAPHITOL

Pat. and Trade Mark Registered.



New Anti-friction Material Bearing.

Graphite is nature's greatest lubricant.

Pure graphite hardened in the **Graphitol** way makes the most frictionless machinery bearings possible.

Graphitol has recently been improved to such a degree of excellence that it is becoming of unquestioned value for many purposes.

Graphitol is shipped in powder form, is mixed with a prepared liquid when required, and applied in paste form, when it hardens durably.

Graphitol bearings mean reduced initial cost, greater efficiency, less oil, and cool running.

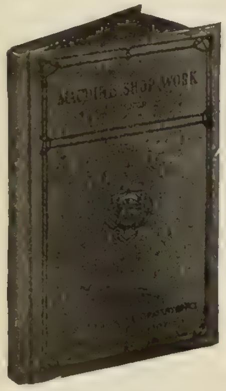
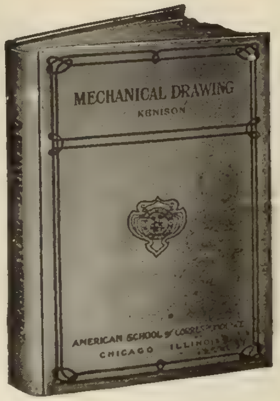
Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.



MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

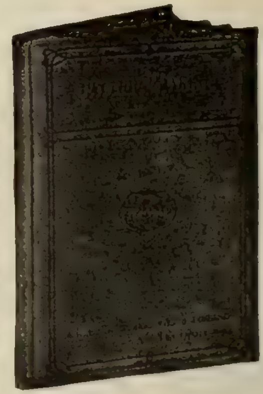


MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price $1.00

FOUNDRY WORK

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00



MACHINE DESIGN

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price $1.50

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers. Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels —annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.50

TOOL MAKING
MARKHAM
TOOL MAKING
AMERICAN SCHOOL of CORRESPONDENCE
CHICAGO ILLINOIS

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.00

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

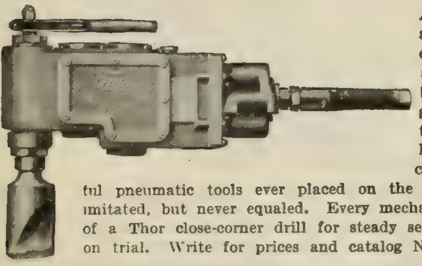
Thor CLOSE-QUARTER PISTON AIR DRILLS



Are the original Nos. 8 and 9 motors for close-corner work. The neat and compact construction of these drills, together with the design of the mechanical parts, have resulted in their becoming the most successful pneumatic tools ever placed on the market. They are often imitated, but never equaled. Every mechanic appreciates the value of a Thor close-corner drill for steady service and economy. Sent on trial. Write for prices and catalog No. 9.

What Do You Think About it?

Our records show that more than 155,000 JACOBS IMPROVED DRILL CHUCKS have been purchased. That more JACOBS IMPROVED DRILL CHUCKS were purchased during April, 1913, than in any other month of our phenomonally successful career. We think these facts are convincing evidence that the JACOBS IMPROVED DRILL CHUCK gives satisfactory service. WHAT DO YOU THINK ABOUT IT?

The advertiser would like to know where you saw his advertisement—tell him.

THE exacting work of grinding milling cutters calls for a wheel that will cut cool—that will cut fast—hold its shape—cut free and to be economical show long life.

ALOXITE
Grinding Wheels

combine these very virtues—that's the reason for their success. For instance, in a big Boston plant—the cutters are made of high-speed steel every one is quickly, accurately ground there is no heating or drawing of the temper—there is a saving in time, labor, and wheel loss.

Aloxite for steel every time—Suppose you order a trial wheel.

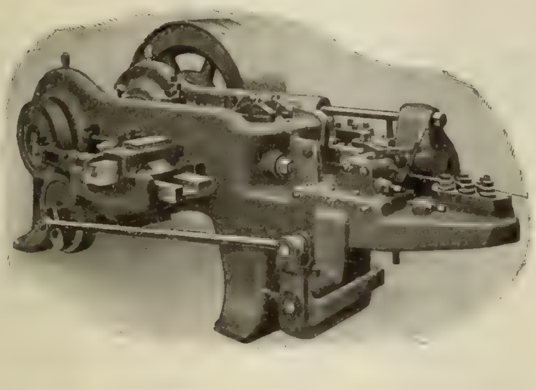
Broken Tangs? Use "Perfect" Double Tang Sockets

What do you do with broken tang drills, otherwise in good shape? With the "Perfect" Double Tang Socket all you have to do is to grind a new tang on the shank below the old one, slip the drill into the socket, and you have practically a new drill—and all done in two to three minutes' time. The new tang is 25 to 60 per cent. stronger.

Folder 19-C gives complete details.

The CLEVELAND Twist Drill Co.

New York **CLEVELAND** **Chicago**



Wire-Drawing Plant

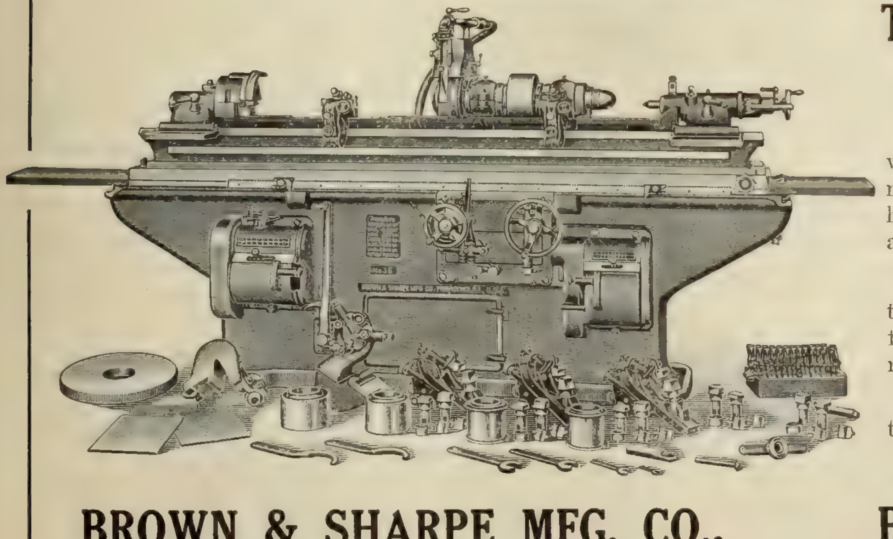
Automatic machines for making wire nails, rivets, bolts, wood screws, cramps for mine rails, hexagonal and square nuts, thread rolling and threading machines; also machines for making barbed wire, chains, etc., etc.

Malmedie & Co.
Machine Manufacturers
DUSSELDORF, GERMANY

The Full Range of 12 Table Feeds Available For Each of 12 Work Speeds

From this independent arrangement of table feeds and work speeds you can get the correct speed to run work and then select a table feed to give the desired finish and production on

The No. 16 Plain Grinding Machine



When rough grinding, a slow work speed with a coarse table feed can be used to remove stock. The combination can then be handily changed to give a fast work speed and fine table feed for finish grinding.

Other conditions that make necessary extreme combinations of work speeds and table feeds are equally well fulfilled by this arrangement.

This machine swings 10 in. diameter and takes work 72 in. in length.

Write for a special circular.

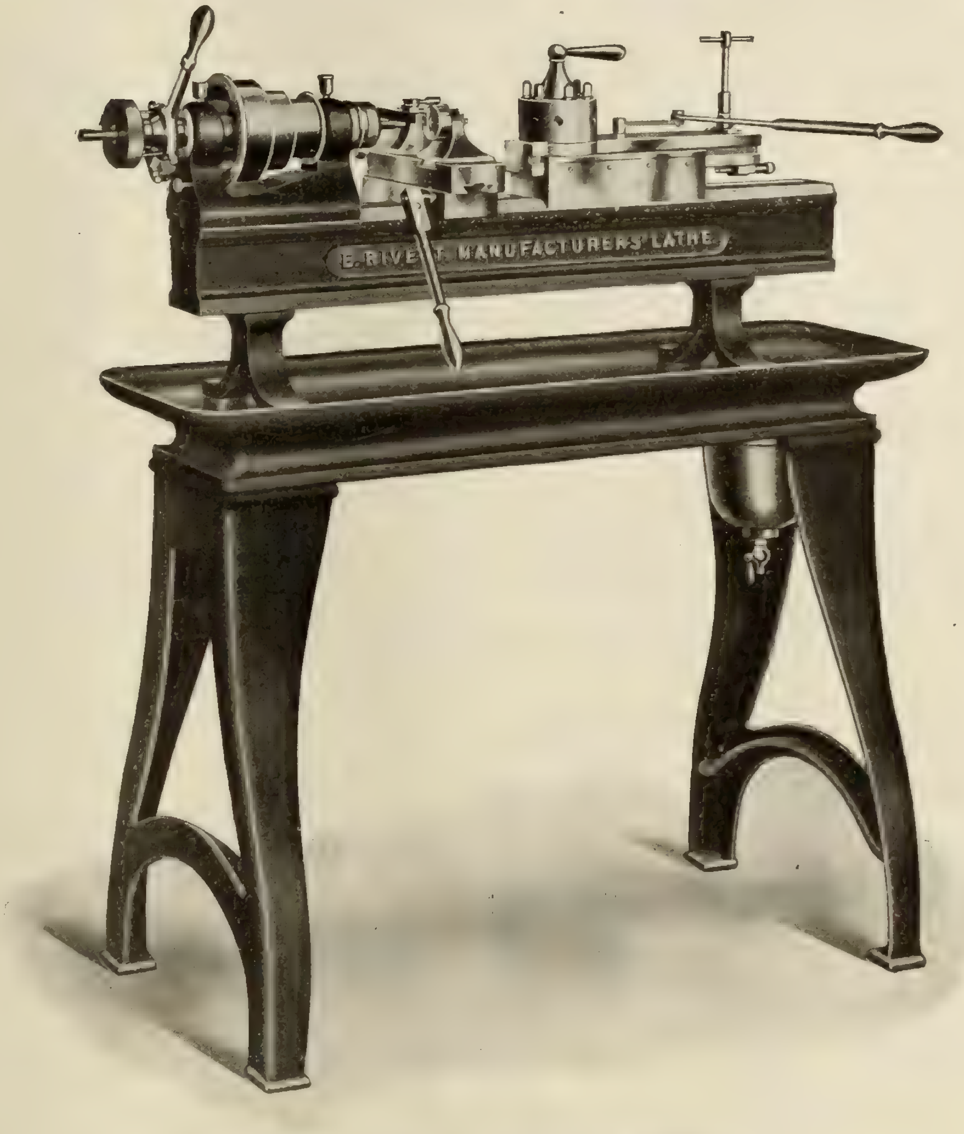
THE RIVETT HAND SCREW MACHINE



THE No. 5 LATHE

38" bed, 18" between centers, 7/8" through spindle, 8" swing, with Automatic Chuck Closer, Cutting-off and Forming Slide, Turret Attachment, Stand and Oil Pan.

The equipment shown here makes as strong and serviceable a screw machine as can be desired. The Lathe is built for heavy work, every part of it being designed to give the necessary strength and rigidity required with the large spindle capacity of the machine. The attachments are simple in construction, handy in operation, and will stand the strain of hard usage.

Nova Scotia Steel and Coal Company, Ltd.

BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

For prices and particulars apply to

Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or Head Office, New Glasgow, Nova Scotia

CASTINGS

IN

BRASS and BRONZE

We specialize on
Bearing Bronze
Gear Bronze
Manganese Bronze

LUMEN BEARING COMPANY
Brass Founders
WEST TORONTO

STEEL CASTINGS

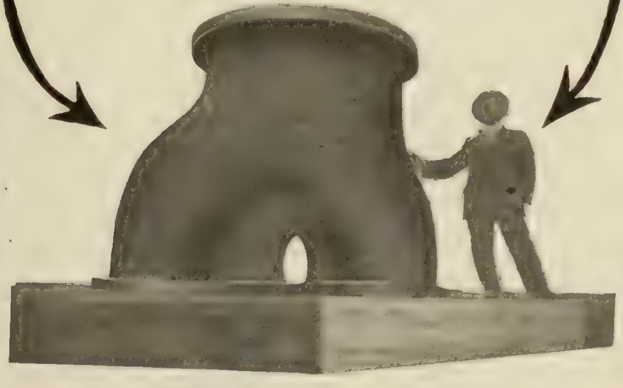
All Sizes, ¼ lb. to 30,000 lbs.

We make **New Process Converter Steel Castings, annealed and unannealed:** also **Chrome-Manganese** and **Nickel Steel Castings.**

Our Castings are perfect, yet they can be procured at a price that will ensure economy.

Every one guaranteed.

Ask us for estimates.



Casting for a 10,500 H.P. Water Wheel

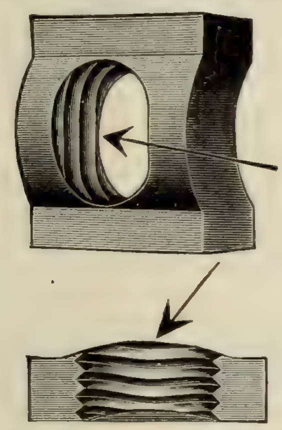
The ? is solved

Where Grip Nuts are Used



This cut shows an exaggerated curve in thread pitch—or more than is given in practice, in order to emphasize this feature

Grip Nuts, being vibration proof, will stay wherever applied until taken off with a wrench. Used on Locomotives, Box, Passenger and Electric Cars, Frogs, Switches, Stationary Engines and Contractors' Equipment.

Samples for tests furnished free. All sizes 5-16 in. to 2½ in. Hexagon and square

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.
TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell
TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

Air Compressors
Cleveland Pneumatic Tool Co. of Canada, Toronto.

An Inside Story Of The Crucible

In the walls of a Dixon Crucible is spun the secret of its efficiency, durability, economy, dependability and its world wide reputation.

If walls had voices, as they are said to have ears, a story of surpassing interest could be told.

—of a concern, the largest, oldest and only one of its kind in the world founded by the inventor of the graphite crucible.

—of a concern with world-wide knowledge of graphite deposits, with use for all forms and grades of graphite and therefore with no incentive to use other than the correct form and grade of graphite in each of its many products.

—of skill in workmanship which only the heritage of 86 years of experiences and discoveries can make possible.

—of a standard which does not permit of anything but absolute uniformity of the highest possible order.

In satisfaction alone it is worth while buying Dixon Crucibles, and in the economy of service Dixon Crucibles are supreme.

Write for booklet No. 223A. "The Care and Use of Crucibles."

SMOOTH-ON

TRADE MARK REG. U. S. PAT. OFF.

SMOOTH-ON
IRON CEMENTS
No. 1, No. 2 and No. 3

Permanently stop all leaks of steam, water, fire or oil, in iron or steel castings, boilers, tanks, piping, pumps, screw thread joints, flanged joints, etc.

Smooth-On No. 4 is unequalled for filling in blowholes in iron or steel castings.

The Smooth-On Cements are easy to apply and make permanent repairs, proved by years in use.

Every engineer should read our new No. 12 illustrated instruction book—FREE. It tells when, where and how to use the different Smooth-On Cements. Send for it now.

THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

FREDERIC B. STEVENS
MANUFACTURER

DETROIT, MICHIGAN. **Export Warehouse: Windsor, Ont.**

A sign of good profits

FOR YOU--FOR EVERY FOUNDRYMAN

Shelton Metallic Filler

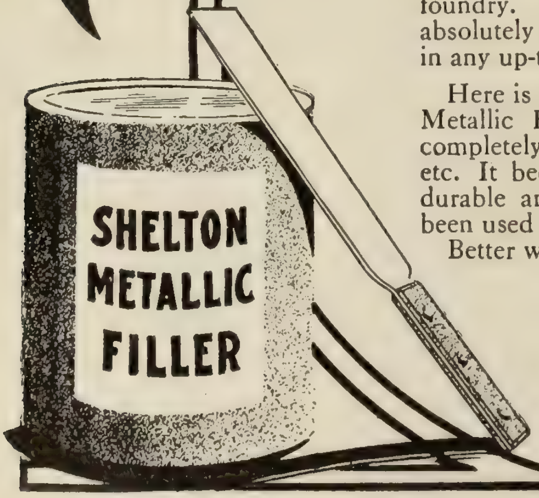
is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

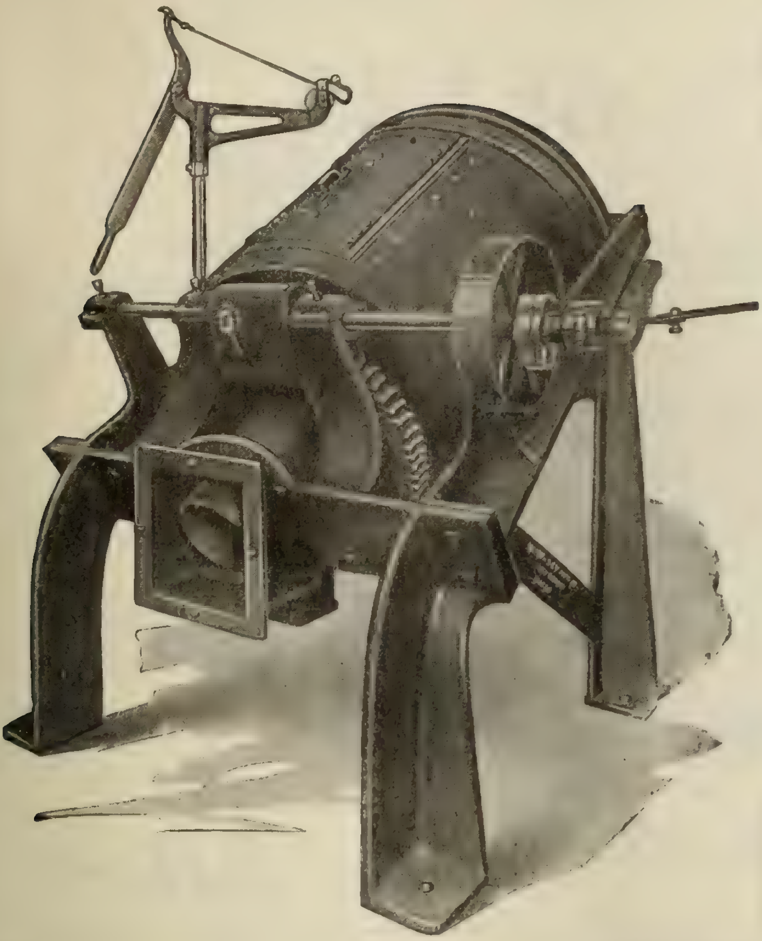
Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years. Better write to us at once.

Every casting means a profit if you are a user of SHELTON METALLIC FILLER

At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*



SHELTON METALLIC FILLER CO.
DERBY, CONN.



"SLY" Sand Blast Mills

Will Reduce Your Casting Machining Cost

This machine has features which makes it the last word in equipment of this kind.

After a careful study of the requirements of the up-to-date foundry we built this machine to produce better work and to save labor and reduce costs. **And it makes good everywhere.**

The "Sly" has a **No-Wear Nozzle. Asks us about it, also the other predominating features. We have Cleaning Mills, Cinder Mills, Rosin Mills, Dust Arrestors.**

Catalogue on request.

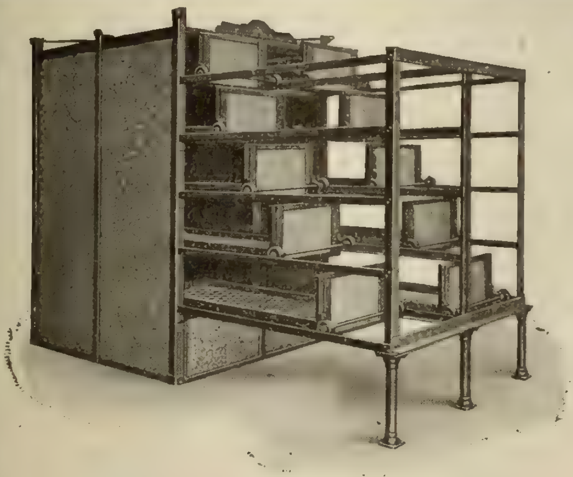
THE CRAWFORD SECTIONAL OVEN
PAT'D NOV. 20, 1906
THE OVEN EQUIPMENT AND MFG. CO. NEW HAVEN, CONN.



The Efficiency of Any Core Drying Plant

depends upon the way the heat is delivered to the cores. If the heat is uneven—not the same from one side of the oven to the other—the cores will be baked unevenly, many of them will have to be made over and many of the others will produce poor castings. This will give the establishment a "black eye," and cannot be justified on any grounds.

CRAWFORD SECTIONAL OVENS

deliver superheated air, constant in both quantity and temperature, while the design of the oven keeps the heat uniform all over the interior. As the air comes from a positive pressure blower, perfect combustion is obtained in the

ENCLOSED FLAME GAS BURNER

and the results cannot be other than satisfactory. If the cores are properly made before they are put into the oven, they will come out perfectly baked.

Let us figure on your requirements. Meantime, let us send you our booklet C.

The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.

Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed. Write us.

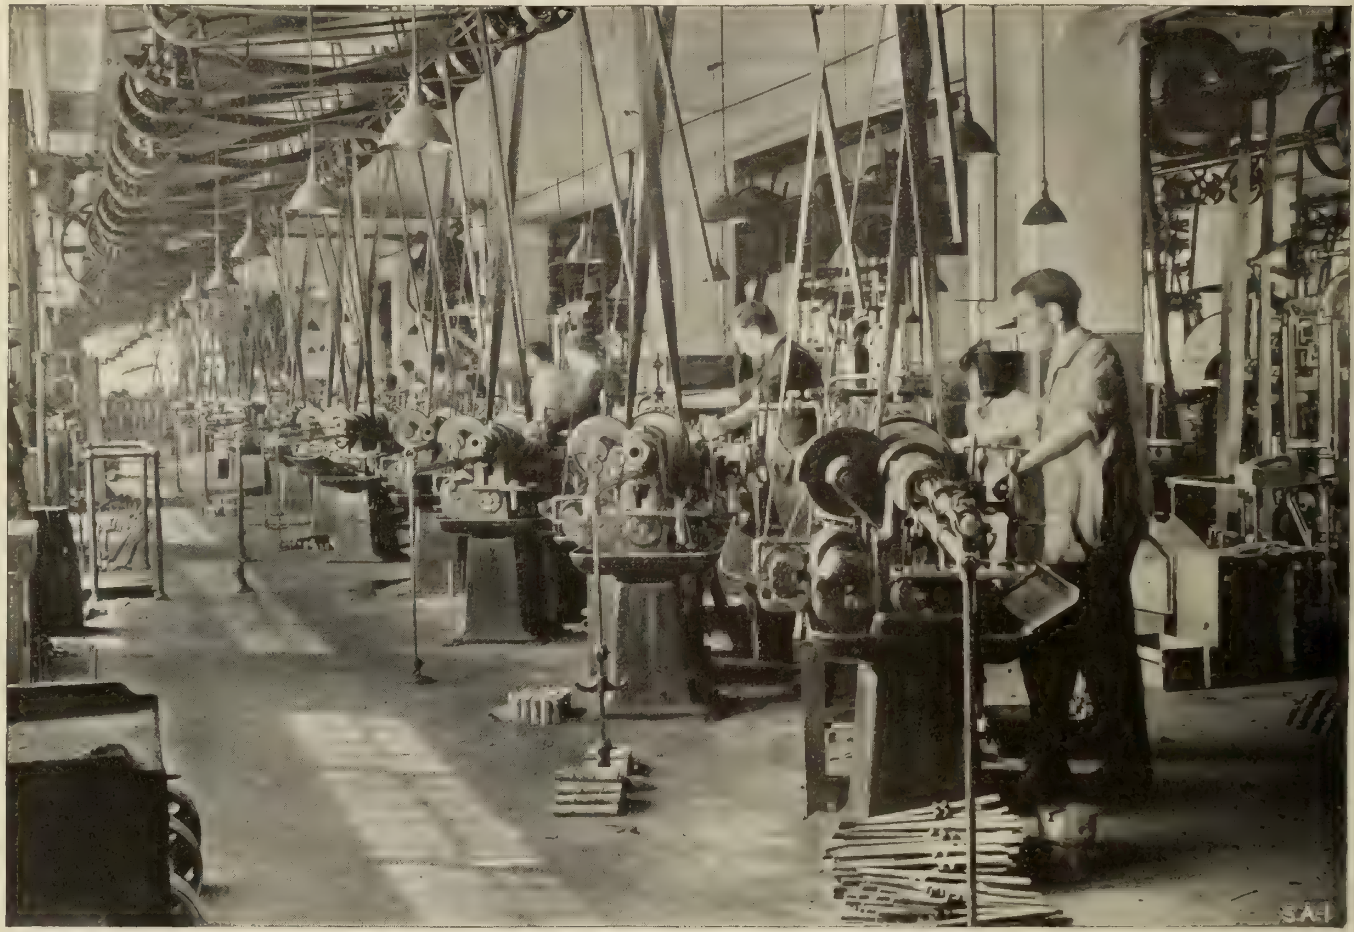
P. & W. Turret Lathes

Doing Excellent Work in Auto Shops

Easily and conveniently operated, provided with adequate tool accommodations and of rigid, durable construction throughout.



Battery of P. & W. Turret Lathes in a large automobile plant, proving very efficient on rod work.

Convenient Speed Control

On 1½" machines and above, double back gears in addition to 3-speed counter make 27 speeds available. Nine speeds can be instantly obtained without shifting belts. Spindle instantly started or stopped by back gear lever within each reach. Clutches of expanding ring type—simple, convenient to adjust and easy to operate.

Automatic Rod Clutch

Combines extraordinary gripping power, extreme accuracy and durability with ease of operation. All parts are hardened and ground, including collet and chuck jaws.

Quick Operating Rod Feed

Improved type hand operated device gives rapid and positive feed. Most efficient and durable. For 2" and 3" sizes automatic rod feed of screw type may be furnished. Very quick and positive in action. Handles rods any shape, rough or smooth.

Accurate Stock Stop

Arm carrying stop swings down from head and does not interfere with tools. Very rigid and allows no variation in length of pieces.

Automatic and Hand Indexing

Turret is indexed automatically by simply running back turret by spider. This mechanism can be released and turret rotated either forward or backward by hand.

Rigid Turret Binder

Turret is rigidly clamped to seat by most efficient device conveniently operated by handle on top of turret. Absolutely no looseness or vibration of turret while tools are in operation. This means increased accuracy.

Positive Turret Stops

Conveniently located on front of machine. Positive in action and easily adjusted. Power feed may also be instantly engaged or disengaged by hand by means of convenient lever.

Adequate Tool Accommodation

Tools are rigidly held to turret by dove-tailed faces and gibs, efficiently backing up tools and arresting twisting strains. Rigid means are provided for holding round shank tools.

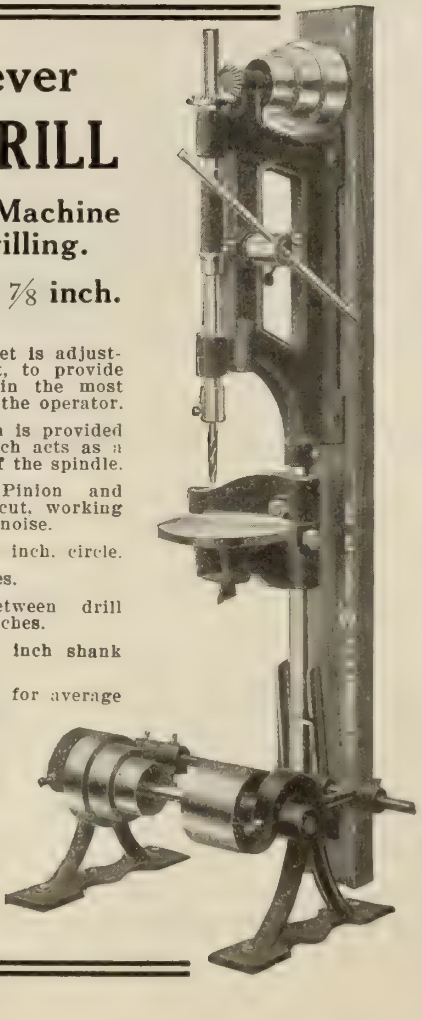
16 in. Lever POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to ⅞ inch.



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

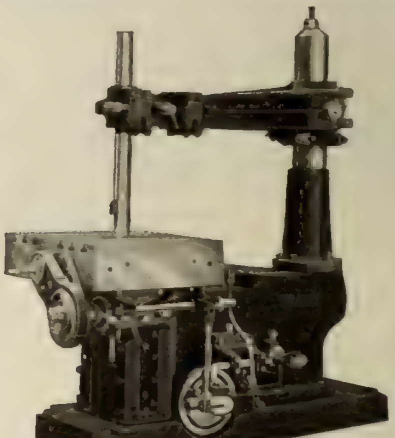
Spindle bored for ½ inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

A. B. Jardine & Co.

Hespeler, Ontario

Keyseater and Slotter



Will cut keyseats, internal gears, internal ratchets, oil grooves, miscellaneous slotting, etc., more accurate and quicker than any machine on the market.

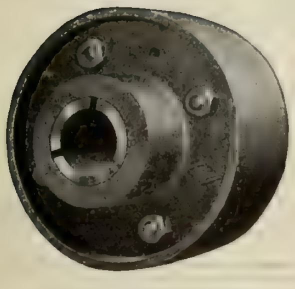
Baker Brothers, Toledo, Ohio.

SHAFTING COUPLINGS

Solid Sleeve

DODGE SOLID SLEEVE

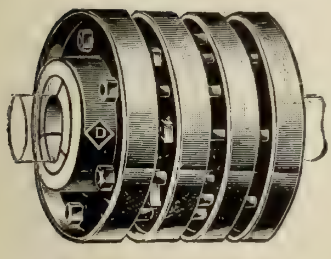
A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.



Single Compression

DODGE KEYLESS COMPRESSION

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.



Double Compression

Note that Groove

It Minimizes Power Waste by Minimizing Belt Slip

Belt slippage is often caused by air getting between the belt and the pulley face. This "air pocket" lifts the belt, lessens the gripping surface, and weakens the belt grip.

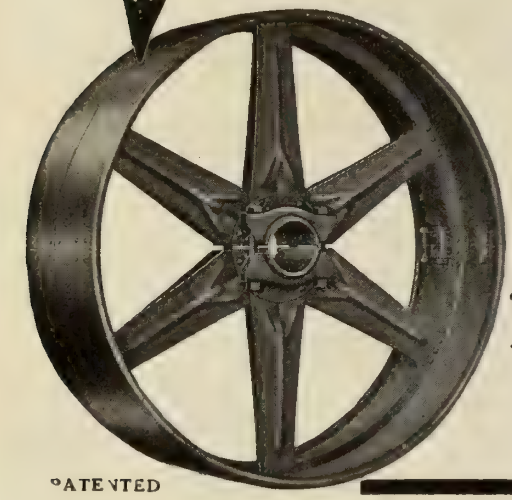
"AMERICAN" STEEL SPLIT PULLEYS

Perfect in Principle Powerful in Performance

are constructed with a grooved "air escape." This not only improves belt contact, but strengthens the pulley by providing a turned-in flange, to which are riveted the spider arms.

"American" Pulleys are light, strong, practically indestructible, and guaranteed for double belt service under any conditions not requiring a special pulley.

Write for "Factors of Energy"—a little, useful book.



PATENTED

THE AMERICAN PULLEY COMPANY

OFFICE AND WORKS, PHILADELPHIA, PA., U.S.A.

Large stocks of "American" Steel Split Pulleys are carried at the following warehouses, insuring prompt shipment to customers.

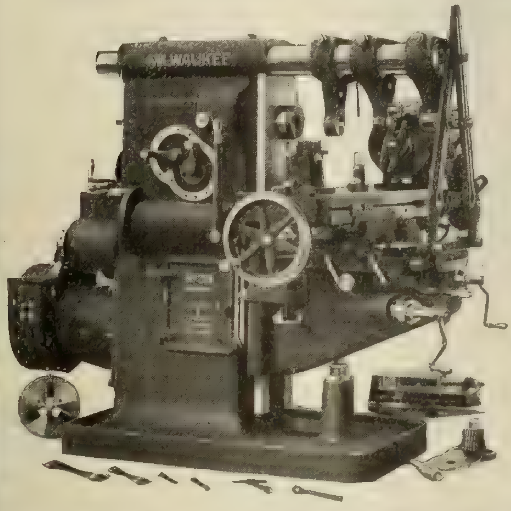
The World's Greatest Tool Makers

WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 8—
Constant Speed Drive

Now that you have satisfied yourself with regard to the basic essential of a milling machine—its rigidity—your next consideration is the drive.



When we started building Milwaukee Millers, we followed general practice and equipped them with cone pulley drive, but soon saw that this method was not 100% effective.

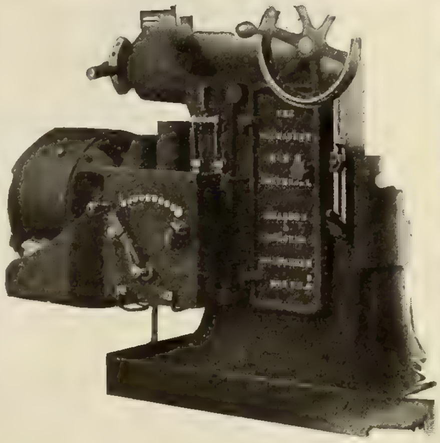
Exhaustive investigation and extended tests proved to us that the **constant speed drive** gave a distinctly superior service for driving milling cutters of varying diameters.

We, therefore, eliminated the cone pulley and ceased entirely the manufacture of this type of machine.

On the Milwaukee there is no countershaft with two or more speeds, reintroducing some of the faults of the cone pulley. It is the "simon-pure" constant speed drive—the pull at the periphery of the cutter being the same at any given surface speed **regardless of its diameter.**

This is a great improvement over any variable speed drive, where you have to reduce belt speed when large cutters are used, thus reducing power when maximum power is most needed.

Milwaukee Millers are furnished with pulley shaft either parallel with the spindle or at right angles to it, or equipped for electric drive. All interchangeable.



Have you missed any of our weekly "WHYS" in favor of Milwaukee Millers? If so, write for our Bulletins. They contain the complete facts. Why not write anyway?

TRADE MARK NORTON REGISTERED

TOOL GRINDING WITH NORTON WHEELS

Alundum Wheels are widely recognized as the unexcelled grinding wheels for sharpening steel tools—a reputation that increases with each passing year.

WHAT OTHERS SAY—

"A very cool, free-cutting wheel; works well dry without burning"—on small high-speed steel tools.

"Hold their shape and cut the steel either red hot or cold"—in the manufacture of air-hardening steel tools.

We make Alundum Grinding Wheels of regular or special temper to meet every tool sharpening requirement. Let us prove it to you.

This cut shows an exaggerated curve in thread pitch—or more (in order to emphasize this feature) than is given in practice.

Throw Away Your Keys and Cotter Pins

There is now no longer any need for them. They were good in their day, but have fulfilled their mission. The world moves and there is now a better way to keep nuts on.

The Grip Nut is the device to do it with. It requires no hole, slot or other change in the bolt and does away with the necessity for cotter pins, keys or other auxiliary fastenings.

The Grip Nut can be removed and put back on again without injury to the threads of either the bolt or nut. It starts easily with the fingers, and then can be tightened with a wrench.

GRIP NUTS

Are being used by the millions on all kinds of machinery, elevators, conveyors, concrete mixers, steam shovels, bridge construction, motor trucks, automobiles, pumps, agricultural implements, etc. They are also being used in vast quantities by the leading railroads.

Universal use is the surest indication of satisfaction.

The secret of the efficiency of the Grip Nut is in the arch, and it is by means of this arch that the thread deflection is given, which enables the Grip Nut to lock on the threads of the bolt.

Manufacturers of machinery, from which it is important that nuts should not lose off, are now using Grip Nuts instead of the old style cotter pins and split keys, or double nut practice.

Grip Nuts are made in all sizes, square and hexagon.

We will cheerfully send catalogue and sample nuts on request. Mention size of bolt.

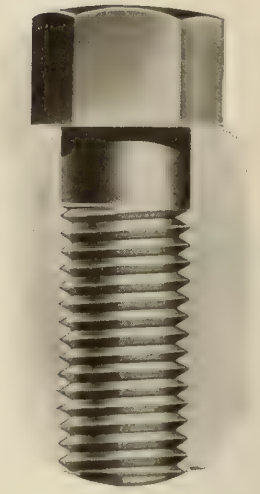
ACCURACY



Accurate, high grade Cap and Set Screws should contain the following essentials:

1st.—Best Material.

2nd.—Uniformity of thread depth.

3rd.—Pitch accuracy.

4th.—Concentricity of thread with body.

5th.—Parallel sides of heads.

Galt Screws have all of the above cardinal points of quality. Try them and be convinced.

Big stock of Finished and Semi-finished Hexagon Nuts.

Life's Everyday Illusions and Realities

Only the man who travels far to reach the treasures of life ever finds them—**for treasures are not treasures** within themselves. Fresh air, the blue sky, the stars at night, the green trees and mountain peaks clustered back against the sky are seldom appreciated where they are easily accessible; but are loved by the traveler who finds it hard to reach them.

Things have no value where they are too plentiful. People living out in the hills surrounded by green grass, sunshine and green trees are no healthier than people who live in the city. In fact the percentage of sickness and the percentage of operations for organic troubles are supposed to be even greater.

In the State of New York there are six thousand patent medicine concerns and these "fakirs" find the country districts their most productive soil—this too in the country where the water is pure, where the air is clean, where the mornings are glorious and where the sky at night is studded with stars—where nature offers every treasure and every advantage.

Children in small towns are no healthier, no happier, no prettier, no more highly developed either physically or mentally than those that live in the city. All this for the reason that we do not appreciate and understand the value of these things that are placed at our disposal without cost and without labor.

Young men and young women in college towns seldom complete the college course, accessible a few blocks away. Yet others who come from afar; who work on tram roads, dig in the mines, skid logs in the woods, work at dingy, dusty desks, and hoe in the fields—stand by their ambition until they have received their diploma.

The missionary who journeys into a far country, who has opportunity to study the religion, the mythology, the history, the temperament, the morals, the philosophy, the ideals of the people in this strange land, seldom acquires an education; seldom learns in ten years what an unprejudiced traveler or historian would learn in ten days. The trouble is they go to teach instead of to study; they go to tell someone else how; and not for the purpose of adding to the sum and total of their knowledge of life and the world.

When we get too close to a thing we no longer see it; and when we get too much of a thing we are sick; and when things come without work, without an exchange of values, we acquire the "big head," or get the gout or the "hook-worm of too much prosperity." The millionaire who is sick, constantly pursued by a retinue of grafting specialists is more miserable and unhappier far than the healthy, vigorous ditch digger.

We fight and struggle and strive and quarrel and wrangle over money and wealth and fame and honor, and in attaining these things lose our health; and so, the man who knows the secret of keeping his mind and body in a healthy condition, is a happier and wiser man than the individual who knows how to make money, but places his health in the care of a hospital.

People who live in one locality, whose ancestors have lived in one locality as far back as memory runs, do not even learn the language of their neighbors a mile away who happen to speak a different tongue. We send our children to Berlin, to Vienna, to the schools of Paris—to learn a language they do not require; a language that will soon be forgotten; yet in a life time we find perhaps three or four men and women who really understand and know even fairly well the richness and the beauty of the English language.

The natives of South America do not know the value of their Birds of Paradise; the value of their rubber trees; so a business man comes down from the North to market these things in order that they may be useful. Fur seals in the Pribyloff Islands have no value, but on Fifth Avenue, New York, one of these furs may sell for a thousand dollars.

We must supply the golden thread of our own happiness and the tourist who goes to Bagdad and Singapore in order to send postal cards to his friends in Elkhart and Kankakee is no happier and no better informed than the man who sits at home reading a copy of Maeterlinck's "Wisdom and Destiny."

Efficiency

THE C. M. A. EX-PRESIDENT

ROBERT SLOANE GOURLAY has played his "Adieu" as president of the Canadian Manufacturers' Association, and has returned to Toronto once more to continue the manufacture of his well-known pianos. It was not all harmony with him at Halifax. Several times there were sharps and flats and discords, but usually by the equanimity as shown in his face, he was able to induce harmony to return. He can now rest his oars a while, knowing that his speech and picture have appeared in newspapers from one end of the Dominion to the other, and that his remarks have elicited comments from the British press.

ROBERT SLOANE GOURLAY
Ex-President Canadian Manufacturers Association

Who is this man who has been in the limelight so much during the past few weeks? Firstly, he is a piano maker, and to be president of such an organization as the C.M.A. he must be no ordinary man. He is no ordinary man who has risen through the stages of cabinetmaker, bookkeeper, and salesman, to become president of a large piano manufacturing concern.

He began his business career as a regular apprentice in a cabinetmaker's shop, after receiving a good education in the Toronto schools. His forte was mathematics, which stood him in good stead when he became a bookkeeper in the employ of Mason & Risch, and Newcombe Piano Co., Ltd. Next he became salesman, and finally general manager. In 1890 the firm of Gourlay, Winter & Leeming was organized.

Besides having held the position of president of the C.M.A., he is a member of the Toronto Harbor Commission, an honorary governor of the Toronto General Hospital, vice-president of the Toronto Associated Charities, a member of the Cemetery Trust, an ex-governor of Knox College, and an ex-president of the Toronto Board of Trade. He has never been mixed up with municipal politics. In Federal politics he is a Liberal, though opposed to free trade. In religion he is a Presbyterian . In his leisure he is bowling or at the National Club. He is in his sixty-first year.

It was because of his sterling worth that Robert Sloane Gourlay was made president of the Canadian Manufacturer's Association.

Storeroom Accounting Methods and Their Application

By W. G. Astle*

An article dealing with the general principles of storeroom accounting and storekeeping, together with a description of the system and record forms of the Toronto Electric Light Co., Ltd.

THE definition of a stores department is that section of a business which has the custody of its stock-in-trade, materials, supplies, and other physical property, except real estate. This department when properly organized becomes one of the most valuable from a profit-making standpoint, but, without organization it may degenerate into one of the most useless. The organization and system must be of the very best to attain the state of efficiency of which it is capable, and like every other department of a business, the organization depends largely upon the nature of the business.

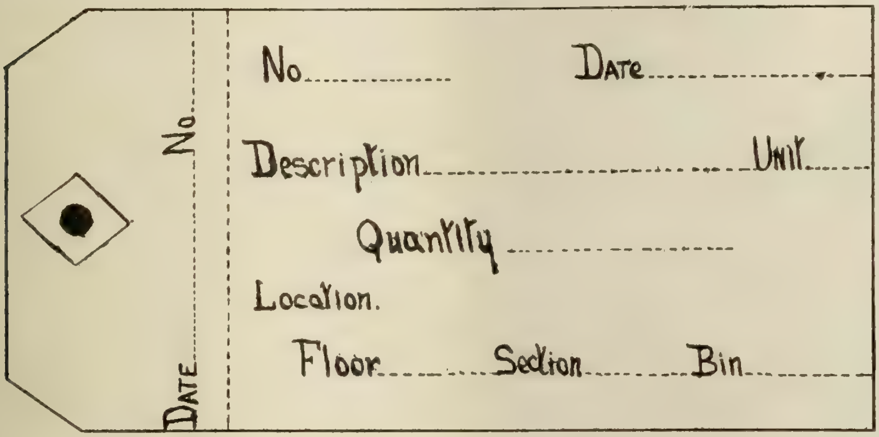

FIG. 1. INVENTORY TAG.

Elasticity Necessary.

To be satisfactory, the accounting system must be elastic. The purpose of a storeroom accounting system is to account properly for all material purchased and used; but the location of the storeroom, its relation to the departments served, and the ability and experience of the storekeeper, may necessitate certain changes in details to meet the local conditions. A theoretical system may be outlined which will afford a perfect record, but, when put into practice, it may not prove satisfactory, or it may be too expensive for the protection afforded. A practical test is always advisable before a decision is made upon a storeroom accounting system for any business.

The storekeeper should be under the jurisdiction of the purchasing department in all matters pertaining to the purchase and receipt of material, but should report to the accounting department in all matters relating to the issue of and the accounting for material. He should be familiar with the material, and should know its uses, but it is not necessary that he should be a skilled mechanic. On the other hand, he should not be simply a bookkeeper, or he may be unable to suggest uses for certain material, and, as a result, a lot of dead stock will accumulate, much of which might be employed for some purpose if brought to the attention of the proper parties. When obsolete material accumulates, it should be sold, as it seldom improves with age.

Inventories.

Before a system can be successfully installed, an inventory must be taken, and from this is formed the basis on which the records are founded. When once this inventory is taken and recorded properly, it is possible to install and maintain a system which will make it unnecessary to take an inventory of all the stock at any one time. It becomes unnecessary to close down to "take stock," for, with the proper methods, it is possible to take a complete inventory without perceptible interruption of the operation of the plant.

First, it must be decided at just what time the stock is to be taken, so as to have everything in readiness. This means a general cleaning up which will make it easy to locate and count, weigh or measure the material and supplies. Then, at the time decided upon, the work of taking the stock can be started simultaneously in every part of the plant.

The stock taken is recorded on a tag, Fig. 1. This tag is perforated near the top. The portion above the perforation shows the date of inventory and the number of the card. This is repeated on the lower part of the card, also the

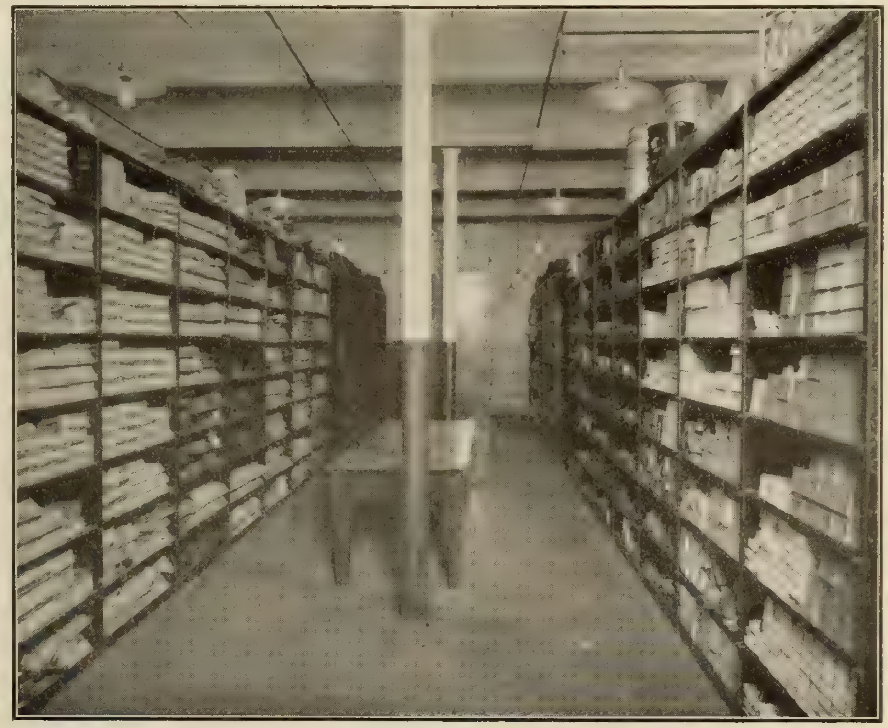

FIG. 2. STEEL BINS IN TORONTO ELECTRIC LIGHT CO. STOREROOM.

---

*Storekeeper, Toronto Electric Light Co., Toronto, Ont.

description, quantity, and unit. By unit is meant the unit in which the material or supplies are priced — pounds, yards, dozen, gross, etc. These cards are consecutively numbered, and one attached to each bin, rack, or pile of material. The clerks and their assistants go through the plant, weigh and count the material represented by each tag, recording the items on the tag. When this is done, the lower part of the tag is torn off. A record is kept of the card numbers given to each clerk, therefore, it is necessary for him to turn in every card. Care must be exercised in placing the cards on every article before the count is begun. The remaining part of the tag is afterwards collected and checked against the main record.

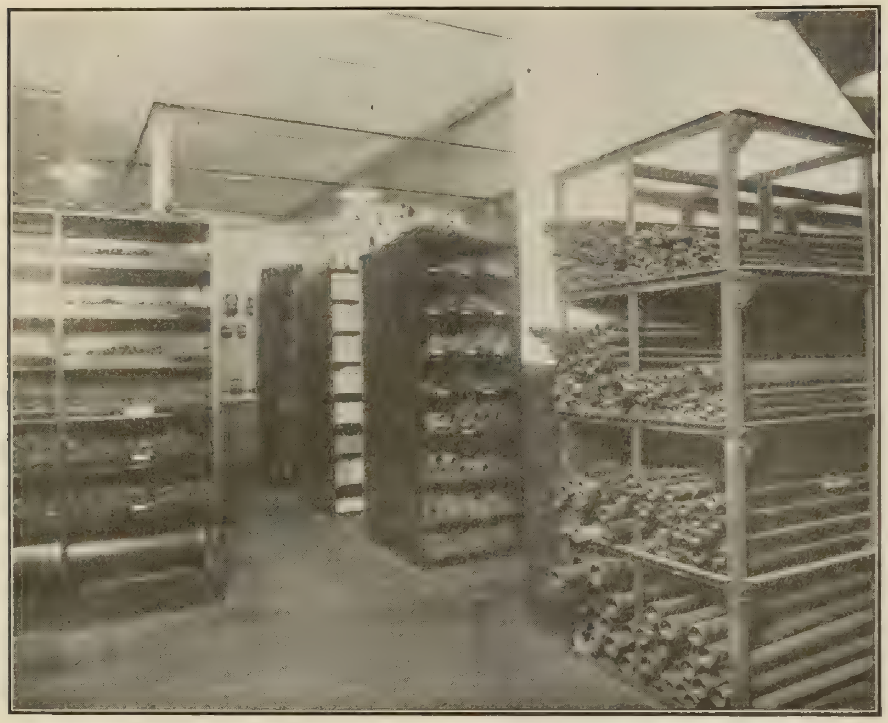

FIG. 3. STEEL BINS IN TORONTO ELECTRIC LIGHT CO. STOREROOM.

Storage.

After the inventory has been taken, the next important step is to have it properly stored. This question of the proper storage place is one which must be worked out to fit conditions as found in the individual establishment. Figs. 2, 3 and 4 show the style of steel bins which are used in the storeroom of the Toronto Electric Light Co., and which have proved to be very satisfactory. Each section should be lettered and each shelf or bin numbered with the name of the material it contains.

Stores Records.

The installation of a stores record system calls for the exercise of judgment of the highest order, for the record of material and supplies is of no less importance than the record of cash. Material should be accounted for with the same fidelity as cash; a dollar's worth of material should be regarded as a dollar in gold.

The records kept in a storeroom are only intended to show quantity on hand. Sometimes these records show prices, but there is no good reason why this should be done. Values should be kept by the accounting department, but, sometimes it is necessary to have the price per unit on record so as to enable foremen or superintendents of the plant to arrive at the estimated cost of work to be done.

These records must show the unit, full description, location in the storeroom, normal stock and minimum stock; date, requisition number and quantity ordered; purchase number and name of the firm from whom purchased, dates and quantities received, and the dates and quantities given out, from which a record every day can be obtained of the quantities on hand and quantities on order. Fig. 5 shows the stock ledger sheet, which is bound in loose leaf ledgers, and used in the storeroom of the Toronto Electric Light Co. This style of stock record has proved to be much better than the card system used previously.

On each day, all requisitions for material to the purchasing department are entered, showing quantities ordered and requisition numbers, and when the material on these requisitions has been purchased, a copy of the purchase order is forwarded to the storekeeper, and its number and the name of the firm from whom bought are entered. All materials received are entered from the duplicate copy of the receiving reports, the original going to the purchasing department. The disbursements are entered from the duplicate daily charge slips, the original being forwarded to the accounting department. The balance on hand is shown each day and verified as often as possible, not longer than one month for each article.

Ordering.

Every article of material is given a low limit. When this limit is reached, the inventory clerk makes out a "low stock report," as shown in Fig. 62, to

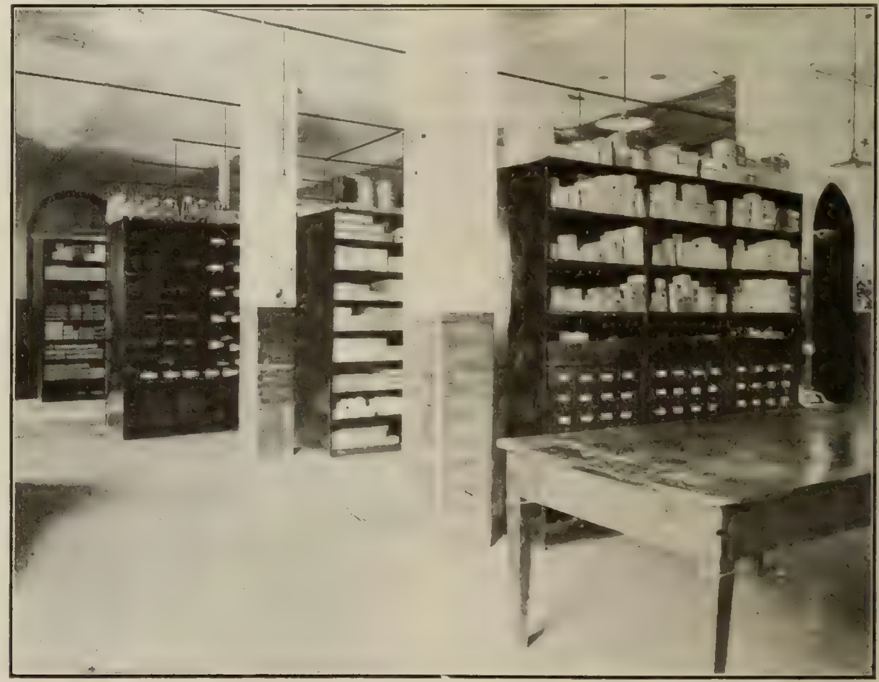

FIG. 4. STEEL BINS IN TORONTO ELECTRIC LIGHT CO. STOREROOM.

the storekeeper. This in turn is verified by the storeroom foreman, and is recognized by the storekeeper as a notice to order. The report shows the low limit and the quantity in stock. The low limit should always be given, for in some cases it is found advisable to change the limit. Material formerly used in large quantities may now be in so little demand that will be found best to reduce the limit. At other times it might be necessary to increase the limit.

FIG. 5. STOCK RECORDS BOUND IN LOOSE LEAF LEDGERS.

Outside departments sometimes require material or supplies not carried in stock; in this case they issue on the storekeeper a requisition for supplies, as shown in Fig. 7.

The storekeeper orders all material through the purchasing department from these two forms of requisition. All orders from the storekeeper are made on the requisition form, as shown in Fig. 8. These requisitions, which are made in duplicate, are forwarded to the purchasing department, the duplicate being retained by the stores department. The material ordered from the "low stock report" is entered in the stock ledger, and the material from the "requisition for supplies" entered on cards, as shown in Fig. 9. These are filed alphabetically under the name of the material ordered. All duplicate requisitions are then held for the storekeeper's copy of the purchase order, Fig. 10, after which they are fastened together and filed away under the name of the firm, to await deliveries. The storekeeper's copies before being filed away are entered in the stock ledger.

Receiving.

Material and supplies for stock are received by the receiving clerk and reported twice a day on the daily receiving report, Fig. 11. From these reports, the storekeeper checks from the copy of the purchase order, and makes out in duplicate for each order a receiving report to the purchasing agent, Fig. 12. Material and supplies ordered for special work are received by that department ordering the goods. Receiving reports for these are made out when the copy of the purchase order is received from the purchasing department. The duplicate copy is attached to the purchase copy and filed away to await deliveries; the original going to the department ordering

FIG. 7. REQUISITION FOR SUPPLIES BY OUTSIDE DEPARTMENTS, AND NOT CARRIED IN STOCK.

After the orders have been completed, all papers, from the requisitions to the receiving reports, which pertain to the order are attached together and filed away under an order number, while a record is kept of all order numbers showing the name of firm on whom the order was issued.

Disbursements.

No material should be issued except on a requisition properly approved, and all supplies issued and not used should be returned to the storeroom and the proper credit given. Before replenishing his supply of any material, the storekeeper should consult the head of the department using this material to determine if any changes in the specification will be made. Failure to do this sometimes causes the storeroom to become overstocked with obsolete material or material that has become useless on account of changes in standards adopted. The losses through obsolete electrical material are enormous, as changes in standards are being made constantly in all departments through the development of the science of electricity, and through inventions which are being placed on the market constantly.

The requisitions on which material is issued should show the use to which it will be put, and the name of the operating expense or other account chargeable.

Fig. 13 shows the requisition form used by this company, and these are always made out in duplicate or triplicate if the department issuing same wish to retain a copy. They are all numbered consecutively. Each day's original copies are sent to the accounting department, and the duplicates retained by the stores department for making the necessary records in the stock ledger, after which they are filed away under the job number or account number. Material returned to the stores is made out on a credit form, Fig. 14. This form goes through the same routine as the requisitions or charge slips.

Scrap Material.

The handling of second-hand material and scrap is very important, and unless a proper record is taken of all second-hand and scrap material as soon as it begins to accumulate considerable loss will result. All scrap should be collected and stored promptly, and as soon as it accumulates it should be sold, as it is very seldom that old material improves with age, and, while fluctuations in the price of metals may warrant the holding of some material for a short time, it is not desirable to keep it indefinitely in the hope that prices will go up.

General Observations.

While I do not consider this system suited for all storerooms, it answers all purposes and is as simple as possible, consistent with good accounting principles. Some may think that it requires too much work and provides too many records, but shortages in material are just as expensive as shortages in cash, and there is no reason why one should not be safeguarded as much as the other. Elaborate systems of accounts are planned to protect the cash collected daily, which amounts to a few thousand dollars, and it is placed in a bank promptly, while many companies leave the storekeeper in charge of material which costs many times the amount of cash handled daily, without an adequate system of storeroom accounting to protect them from loss. It is better to have a few extra records and protection than to omit these records and take chances of shortages.

* * *

MELTING BORINGS.

A SUCCESSFUL method of melting borings is referred to in the columns of an American contemporary. After a heat has been taken off, and the bottom of the cupola is a mass of glowing coke, the blast is shut off and a ton of borings is shovelled into the cupola. In a few minutes the material melts into a pasty mass. When this condition occurs, the blast is turned on again, and in a few minutes, it is stated, the charge is ready to be poured. It is run into grate bars or similar castings, or is poured into pigs and mixed with the scrap charge the next day. The method has been found more satisfactory, it is claimed, than boxing the borings, and has reduced the foundry costs $5.00 a day.

* * *

Don't run unnecessary risk, but — little venture, little win!

Determining the Shop Costs of Boiler and Plate Works*

By W. C. Connelly**

A plea for more systematic accounting of the various factors entering into the manufacture of boilers and kindred specialties; it being claimed that due to a more or less existent indifference to the feature of overhead expense, there is unmistakable evidence that the boiler-making business does not yield returns commensurate with its importance and comparative professional status.

IN the manufacture of boiler-shop products, three principal articles enter into the cost—namely, material, labor, and overhead expense. It is an easy and simple matter to obtain the exact cost of the material entering into any job. In obtaining our labor cost, there are various methods, some of which are good and others, in my opinion, of not much value; but, as I hope that not later than our next Convention some one will go into this subject in detail, I will assume that all boiler manufacturers have a good method of arriving at their labor cost. As to the third item, known in a general way as overhead expense, it seems to me that boiler manufacturers in general have not placed enough importance on this subject, learned enough about it, or determined what relation it bears to the business in general; that is, its relation to the shop pay-roll and to material purchased.

No doubt we might go to an extreme in this matter of costs, but I have no fear of any boiler manufacturer doing so. On the other hand, I feel that a large proportion do not go into this subject far enough, and for this reason sell their product at little or no profit and do great injury to themselves and others engaged in the same line of industry.

Overhead Expense Accounts.

I would suggest that the following items of expense be carried under separate accounts by all boiler manufacturers, in order to properly determine their overhead expense:

- General
- Legal
- Advertising
- Traveling
- Drafting room
- Taxes
- Fire insurance
- Liability insurance
- Heat, light and power
- Interest
- Discount
- Water rents
- Cartages
- Stable account (if you own your teaming outfit)
- Machinery repairs
- Building repairs
- Tool steel
- Salaries of officers
- Salaries of office force
- Non-productive labor

No doubt all of the above titles denote exactly what items ought to be charged under them, with possibly the exception of the last one. Under non-productive labor should be charged the salaries of superintendent and foreman, also wages of engineer, fireman, night watchman, teamsters, traveling crane operators, and the general repair man, as no plant is without at least one such man.

The 20 items enumerated above are by many considered as their total overhead expense, but my opinion is that they are not correct. To the total of these items should be added an amount equal to 6 per cent. on the actual capital invested—not the authorized capital stock, as that may be more or less than the investment. This amount should be added for the reason that one would have to guarantee a net 6 per cent. to the owners of the plant if the company operating it were not the owner. We should also add for depreciation on buildings and equipment, and I would suggest that 25 years be estimated as the life of buildings, which would mean a 4 per cent. depreciation on their first cost. I would also assume that the life of machinery and equipment be estimated at not more than 15 years, and this would mean about 7 per cent. depreciation on their first cost. These items, added to the total of the 20 given above, would then represent the total overhead expense.

Perhaps some of you have noticed that I have not included the items of freight and commission. I do not feel that they ought to be included, because, as a rule, all plates, tubes, etc., are purchased f.o.b. our track, and the freight on them is added to the mill invoice, so that this takes care of all inbound freight. It is a simple matter to add to the estimate sheet the amount of freight from our plant to destination, so that this covers all outbound freight. In the same way should the commission be added, if there is to be any.

Overhead Expense Relation to Business Done.

After finding our total overhead expense, the next step is to know what relation in percentage it bears to our work. The question is—should this factor be determined by comparison with total sales or by comparison with total pay-roll of shop force?

FIG. 10. STOREKEEPER'S COPY OF PURCHASE ORDER.

A journal that comes frequently to all boiler manufacturers had an article on the subject recently, which stated that this factor should be got by comparison with total sales. To this I would take exception in so far as boiler manufacturing goes, as I believe the proper method is to make comparison of overhead with shop pay-roll. No doubt a great many boiler manufacturers are using the former method and are continually cheating themselves, as I shall try to illustrate.

---

*Paper read before the American Boiler Manufacturers' Association, Cleveland, Ohio, September, 1913.

**President, the D. Connelly Boiler Co., Cleveland, Ohio.

Most boiler manufacturers build a general line of boilers and other steel plate work. Now, take as an example the estimate for a small fire-box boiler, made in accordance with United States marine laws, for a small craft like a river tug. I have taken off the cost record of such a boiler, and find the actual cost of material approximately $500 and the actual cost of labor was approximately $600, thus getting a total of $1,100 for these two items. If one should add to this total an amount equal to that determined by figuring overhead against sales, we will assume that he arrived at 25 per cent. as his factor, and in this case it would be equal to $275, so that the total cost would then be $1,375; and assuming that he adds 20 per cent., which would only net about 16 per cent. on the sale, he would then have $1,650 for a selling price.

Now, by using the other method of getting an overhead factor, he will find that his overhead total is at least equal to his shop pay-roll, or 100 per cent. To the $1,100 for material and labor, he will add $600, or the amount equal to his actual pay-roll on this boiler, and he then gets a cost of $1,700, and to this adds the same 20 per cent., getting $2,040 for a selling price.

By the first method he has sold the boiler at $50 less than the actual cost, although his record makes him believe that he has had a profit of $275. Furthermore, you will note that it took $600 to produce a sale of $2,000, and the same amount of labor applied to simpler work would have produced, roughly, $5,000 in sales; as the margin is figured on the cost, the profit made on the tug boiler is only about one-third of what it would have been on the other class of work.

FIG. 14. CREDIT FORM FOR MATERIAL AND SUPPLIES RETURNED TO STORES.

It must therefore appear that a larger margin of profit should be had from difficult jobs. However, I feel that a net 16 per cent., as given above, is small enough on even the simplest work, for the reason that, after considering the amount of capital invested, the small volume of business that a boiler shop can do as compared with the total investment, the years of experience and knowledge necessary to successfully operate a plant of this kind, it is to-day the most underpaid industry connected with the iron and steel business.

FIG. 12. RECEIVING REPORT TO ACCOUNTING DEPARTMENT FOR EACH ORDER.

Service Value.

In some of our boiler manufacturing establishments where the ownership rests wholly with one or two men, there still remains an old custom of granting to the owner or partners a nominal drawing account, so that when the books are closed at the end of the fiscal year they show a good profit. This, in my opinion, is wrong, as the men who give their entire time to the business ought to charge against the business salaries commensurate with their services, or what they would work at for some one else. Unless they do this they are fooling themselves in regard to the actual returns from their investment.

It takes as much study and labor to be a successful boiler manufacturer as it does to be a good lawyer or a good doctor, and lawyers and doctors to-day refuse to sell their services for less than $50 per day upward; and why should the men in this industry, who have equal ability in their line, sell their brains and time for little or nothing? I would here state that I am strongly in favor of economical management, but would also give to those who carry great responsibility a fair remuneration for their services.

The great trouble, in my opinion, is that we do not charge enough into our overhead. Some leave off the interest on their investment; others enter drawings as an asset instead of charging them as an expense; others enter patterns and dies in their assets at full cost price; others will trade off old tools, as, for instance, an air hammer or drill, and credit to their assets the amount paid in trade. This is all wrong, in my opinion,

I would also suggest that there should be a general rate attached for the use of such tools as hydraulic riveters, hydraulic, flanging machines and presses, large bending rolls, etc. To-day in Cleveland it costs 90 cents per hour for plumbers on repair work, 85 cents per hour for high-grade carpenters on repairs, and 60 cents per hour for a machinist in any auto repair shop, and they have no power to furnish, and only such tools as can be carried in a satchel, and yet there are very few, if any, of us that can say we average 60 cents per hour for all our help.

I take it for granted that we are all in business to make money, and we must, therefore, co-operate to our mutual benefit, and if we will carefully look into our costs and then try and get a fair margin for what we do, we will help to get the boiler business back where it belongs, as I feel that it has never recovered from the business depression of 1907 and 1908. The costs of plates, tubes, labor, etc., have been going higher steadily, and the price of boilers has advanced but slightly, if at all. I feel safe in stating that there is not a boiler manufacturer present who feels he has had equitable returns on his labors during the past few years.

* * *

JAMES ROSS, RAILROAD BUILDER, DEAD.

THE death occurred on Saturday morning, September 20, at Montreal, of James Ross, the well-known railway contractor and engineer. He had been suffering from heart trouble for two weeks past.

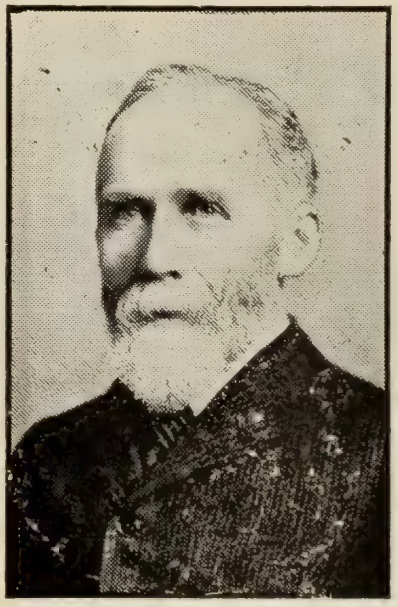
Steam Railroad Achievements.

Mr. Ross was born at Cromarty, Scotland, in 1848, and received his education in Scotland and England. After spending some years on railway, harbor and waterworks construction in Great Britain, he came to the United States, and in 1870 became resident engineer of the Ulster & Delaware Railway. He was afterwards chief engineer of the same road. During 1873 he acted as resident manager of the Wisconsin Railway, and subsequently held a similar position on the Lake Ontario Shore Road. In 1878-9, Mr. Ross built the Credit Valley Railway, and was appointed its general manager. He was also consulting engineer of the Ontario & Quebec Railway. He was next engaged on the construction of the Toronto, Grey and Bruce, and Victoria Railways. All of this was before he undertook what was probably the greatest work of his life, the building of the Rocky Mountain section of the Canadian Pacific Railway. He was at first an engineer on this work, but later undertook the contracting.

In 1883 he took control of the construction of the Canadian Pacific Railway west of Winnipeg, and in 1885 completed for the company their line over the Rocky Mountains, the Selkirks and the Gold Range. After having completed this work he built what is now the Edmonton-Calgary branch of the C. P. R. Later came the Regina and Long Lake line, which is now owned by the C. N. R. In 1886 he undertook for the C. P. R. the settlement of their location east of Montreal, and their legislation in Maine, and, upon the completion of this work, took the contract for the construction of the remaining portion of their line.

Electric Railroads and General.

Later he turned his attention to the building of electric roads. He built the present Toronto Street Railway, and was interested in electric lines in Montreal, Winnipeg, St. John's, and in Jamaica. He also had a franchise in Birmingham, England, which he had bought from Mackenzie and Mann, and which he afterwards sold to the City of Birmingham. In Mexico he developed an immense water power, and was first president of the Mexican Power Company. His last great enterprise was the development of the Dominion Coal Co., Cape Breton, N.S., the product of which he increased to over three million tons output per annum. At the time of his death he had retired from active direction of many of the important interests with which his name had been prominently associated. He was also prominent in developing the iron and steel interests, and the great fight for control of these a few years ago will not soon be forgotten.



THE LATE MR. JAMES ROSS.

Wide Activities.

He had held among other offices that of vice-president and managing director of the Montreal Street Railway, president of the Winnipeg and St. John Street Railways, president of the Dominion Bridge Co., director of the Bank of Montreal, director of the C. P. R., and Commodore of the Royal St. Lawrence Yacht Club. He was also a trustee of the Bishop's College University at Lennoxville, Governor of the Royal Victoria Hospital, Governor of McGill University, and President of the Montreal Art Association.

Prominent in Yachting.

Of late years he had taken an active interest in yachting, and was the owner of the Glencairn, which won the Seawanhaka Cup for half raters in American waters in 1896. He owned two steam yachts, and cruised extensively in Canadian and European waters.

He was a member of the Mount Royal and St. James Clubs, Montreal; the Rideau Club, Ottawa; Toronto Club. Manitoba Club; the Players' Club of New York, and many others.

An Art Connoisseur.

He was a great connoisseur of paintings, and had what is probably the finest collection of old masters and examples of the great modern schools in Canada. He was greatly interested in hospital work, and erected one in Lindsay to the memory of his father, who had lived in that place, with others of the family, when the Victoria Road was being built. He was one of the great men of Canada, a cautious, and yet a bold financier. He has been spoken of as an Empire builder.

POWDERED FUEL FOR INDUSTRIAL PURPOSES.

MARKED progress is being made in the use of powdered fuel for industrial purposes in the United States, including its use in cement mills, and more recently in its application to heating furnaces, and it is expected that this will be followed by its successful application to locomotives. The advantages claimed for pulverized fuel are the better and more prompt intermixture of the gas and the air, thus providing a practically perfect combustion and the absence of smoke. This will necessarily be followed by better performance of the boiler and the locomotive as a whole. A large number of attempts have been made to use a fuel of this kind in the locomotive, but without success.

Mr. Walter D. Wood, in an article in the Railway Gazette, analyses the failures that have followed these attempts, and offers suggestions as to how they may be overcome. A difficulty not mentioned is that of carrying the pulverized fuel on the tender. It will probably be necessary entirely to re-design the tender to provide for its successful handling. It is finer than soot, if that be possible, and may have to be carried in air-tight containers. Its storage at the coaling stations and its transfer to the tenders offers a complicated problem which may be solved after its use in the locomotive fire-box has been demonstrated a success.

New Machinery Hall, Canadian National Exhibition, Toronto

By W. Almon Hare, B.A.Sc.

With a view to securing an expression of opinion from manufacturers of mechanical, electrical and hydraulic engineering equipment, concerning the fitness of the present Machinery Hall at the Canadian National Exhibition, and in order to get an indication as to what extent additional representation might be forthcoming, were a more suitable building erected in which to house mechanical and electrical products, "Canadian Machinery" has been in communication with representative engineering concerns throughout the Dominion. As a result, there have been collected considerable data relative to the need, not only of a larger Machinery Hall, but indicative of its constructional features, capacity, etc. Our readers' criticism and ideas concerning the whole question are invited.

AS you were kind enough to request me to give you my idea as to the facilities that should be provided at the Canadian National Exhibition for the proper display of machinery of different kinds, and which would bring before the public a more correct understanding of the importance of the many and varied industries established for its production in Canada, I am pleased to outline some of the ideas that have occurred to me.

The Location Feature.

First, let me say that an entirely new Machinery Hall is required, and on a new location in the grounds. The present location, owing to the recent lowering of the Grand Trunk tracks to the north, has made it impossible to switch a car into the building, and this I consider so important that any new location that did not provide this facility would prove a failure. The material to be exhibited in this proposed building is all of a heavy nature, and can be handled in only one way economically; that is, by bringing the railway cars into

PROPOSED NEW MACHINERY HALL DESIGN, CANADIAN NATIONAL EXHIBITION, TORONTO.

---

*President, the Hare Engineering Co., Toronto.

the building, and having proper crane facilities to lift the machinery from the cars and place same in any part of the hall.

Size of Building.

With regard to dimensions, I am of opinion that a new steel building 600 ft. long by 125 ft. wide would not be any too large, considering the number of firms who would avail themselves of the opportunity to exhibit, if the proper facilities were provided. This building should be constructed in two bays, each 600 ft. by 62 ft. 6 inches, thus providing opportunity for the erection of two 10-ton motor electric travelling cranes, each with a nominal span of 60 ft., and running the entire length of the hall. If the railway tracks are brought into the building on a line at right angles to the length, the cranes will pass directly over the cars, and will thus give all necessary facilities for the rapid and economical loading and unloading of heavy machinery, etc. If the Commissioners cannot see their way to erect the whole building as above outlined and illustrated, the ground should certainly be secured, and held in view of an extension by adding length only, so as not to call for the erection of a third crane.

Interior Underfloor Conduit Feature.

As a great number of exhibitors have apparatus that requires either steam or compressed air for its operation, I suggest making a conduit, say, five feet wide all around the inside walls and below the floor line. In this conduit would be placed:

(1)—A high pressure steam line.
(2)—Exhaust steam lines.
(3)—High pressure water lines.
(4)—Exhaust water lines.
(5)—Gas pipes.
(6)—Alternating current wires, low tension.
(7)—Direct current wires, 250 volts.
(8)—Compressed air.

These pipes and wires would be provided with tapping stations every 25 feet, so that any exhibitor, by making application for such facilities as he wanted, could tap these lines and make necessary connections to his apparatus. In the case of the gas mains, individual meters would have to be provided, and these lines could be connected to the city gas mains through a single meter. The gas would, of course, have to be paid for by the exhibitor.

The compressed air could be provided by any of the exhibitors of steam or electrically driven air compressors, and would, I have no doubt, be provided free. The steam would be supplied from the power station of the C.N.E., which should be erected immediately adjoining the Machinery Hall. The direct and alternating current would also be provided by the C.N.E. power station, and by the exhibitors of steam turbine and engine driven generators. By this arrangement any exhibitor could either deliver power from, or secure power for any exhibit in the entire building.

Power House Feature.

The power house of the C.N.E. should be designed to carry the entire Machinery Hall load, both for lights and power, so as not to require any further demand on the hydro system. This cannot be done without considerable expenditure, but it will be impossible to get exhibitors of steam apparatus, unless they are given facilities to operate their equipment. It means, of course, a modern boiler plant with stack and mechanical stokers.

It would also be advisable to have a steam turbine generator or engine generator in addition, to assist in the current load throughout the Exhibition Grounds, but I presume this would not be so much a question of cost as one of policy. In any case, there would be a considerable current load provided by the exhibitors of steam operated electric generators, and steam for these units would have to be provided.

Transmission Equipment Feature.

For the operation of equipment that does not call for either steam, electricity or gas, lines of shafting should be provided on either side wall, and on the centre columns. This shafting should be operated by motors at or near the centre of the building, mounted on brackets so as to be out of the way, and geared to the shafting by chain drives so as to secure close centres. The shafting should have frictionless bearings and be available for driving all small apparatus which operates only by belt.

Permanent Equipment Installation.

I have no hesitation in saying, as a result of conversations with various manufacturers of equipment, that there would be no difficulty in securing a great deal of this equipment at prices considerably below that usually quoted, on account of the advertising value; and further, the designs and specifications can be had practically without charge to the C.N.E.

An Expert's Job.

In conclusion, I would say that this whole matter should be put in the hands of a consulting engineer, who has made a specialty of factory construction, as in no other way will the proper details be worked out. To put a matter of this kind in the hands of an architect would be to spoil the whole project, as it is distinctly within the field of the consulting engineer.

Certainly nothing should be allowed to interfere with the carrying out of the scheme in the best possible way. No questions of cost should be considered when providing that which is absolutely necessary to properly represent this tremendous branch of industry. In my opinion, if the facilities are provided such as outlined above, there will be no parties more surprised at the resultant Exhibition in the new Hall than the Directors of the C. N. E. themselves, as the general public have absolutely no idea as to the importance of the part that machinery plays in our national development.

◆

ONTARIO LEADS IN MINERAL PRODUCTION.

SINCE 1900, Ontario has advanced from second to first place among the provinces in mineral production of the Dominion. British Columbia, which, prior to 1904, when the Cobalt silver camp in Ontario was opened, held first place for value of mineral output, has been displaced by Ontario. Such is the conclusion gathered from the figures of the latest bulletin published on the census of 1910-11.

Nova Scotia, since 1909, has moved up to third place. The Yukon, which has been displaced by Nova Scotia for third place, has now fallen to sixth among the Dominion's mineral-producing provinces. The other provinces maintain about their relative positions in the following order: Quebec, Alberta, Manitoba, New Brunswick, Saskatchewan and Prince Edward Island.

Cobalt Camp the Feature.

The growth of Ontario's value of production is mainly accounted for by the opening of the Cobalt silver camp in 1904, which in the last census year yielded $17,637,256 of the total silver output for Canada of $18,899,240.

Compared with the census for 1900, the last census shows an increase in the ten years of 849 in the number of mines and works in Canada, of $65,734,248 in the value of buildings and plant, of 31,442 persons employed, and of $74,048,070 in the value of production.

Coal, Silver, Gold, Clay, Etc.

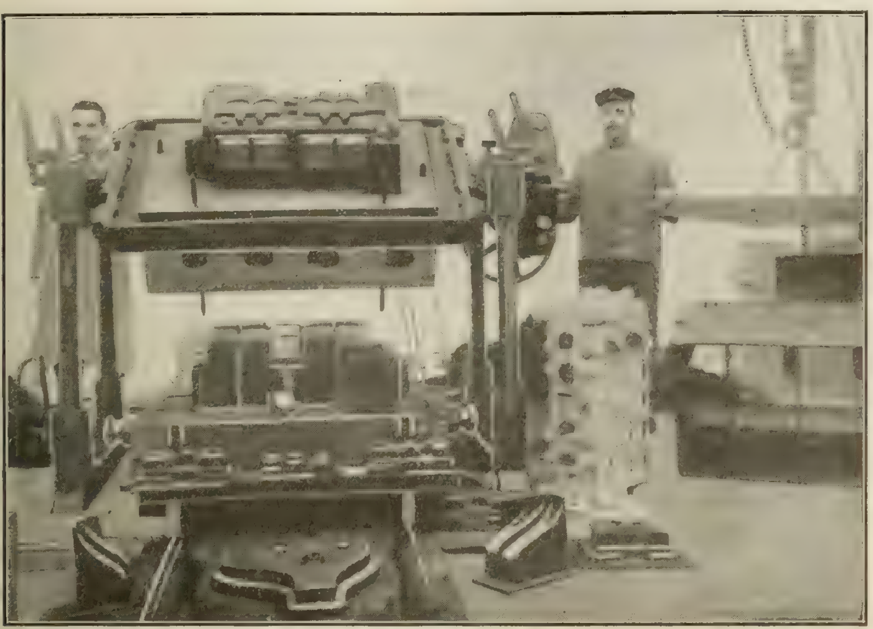
Coal, both as to tonnage and value, occupies the first place, with a value of $32,580,841; silver in ore and in combination second, with $18,899,240; gold third, with $10,302,973; clay products fourth, with $9,562,302; nickel fifth, with $8,276,313; copper sixth, with $7,581,552; stone seventh, with $6,372,474; and cement eighth, with $5,851,066, being respectively 26.7, 15.5, 8.4, 7.8, 6.8, 6.2, 5.2 and 4.7 per cent. of the total value of production, which was $122,004,932.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

MOULDING MACHINE FOR MOTOR CRANK CHAMBERS.

THE accompanying illustration and description refer to a machine for making the moulds in which the aluminium crank-chambers of the engines used on the motor-buses of the London General Omnibus Co. are cast. Hydraulic rams are fitted for raising the pattern, and, as will be seen, the table is fitted with a mechanical turn-over and stopping device, which is operated by worm and hand-wheel. The pattern is mounted on either side of the table. The table is raised or lowered by four uprights, one at each corner, and these are connected by a girder frame to a hydraulic piston below the machine. A trolley runs under the table from the front to carry the finished boxes. The pattern shown on the machine is for an aluminium gear-case which is moulded in a box measuring 40 in. by 24 in. internally. In the bottom, or core-box, are the loose cores and draw-back pieces.



MOLDING MACHINE FOR MOTOR CRANK CHAMBERS.

Operation Features.

The machine operates in the following manner:

The bottom box is first clamped on the reversible table, filled with sand and hand-rammed. The sand is then struck off, the table is reversed, and the box rests on the trolley. The clamps are then removed, the table being at the same time raised and the pattern drawn clear of the mould. The draw-backs are next removed, the cores set, and the bottom box is carried by a crane to the moulding floor. The same operation is carried out with the top box, the two halves are then clamped together, runners and risers finished, and the mould is ready for pouring. The complete operation is carried out by two workmen, the time required to make a complete mould being about one hour.

J. W. Jackman & Co., Caxton House, Westminster, London, S.W., are makers of this machine.

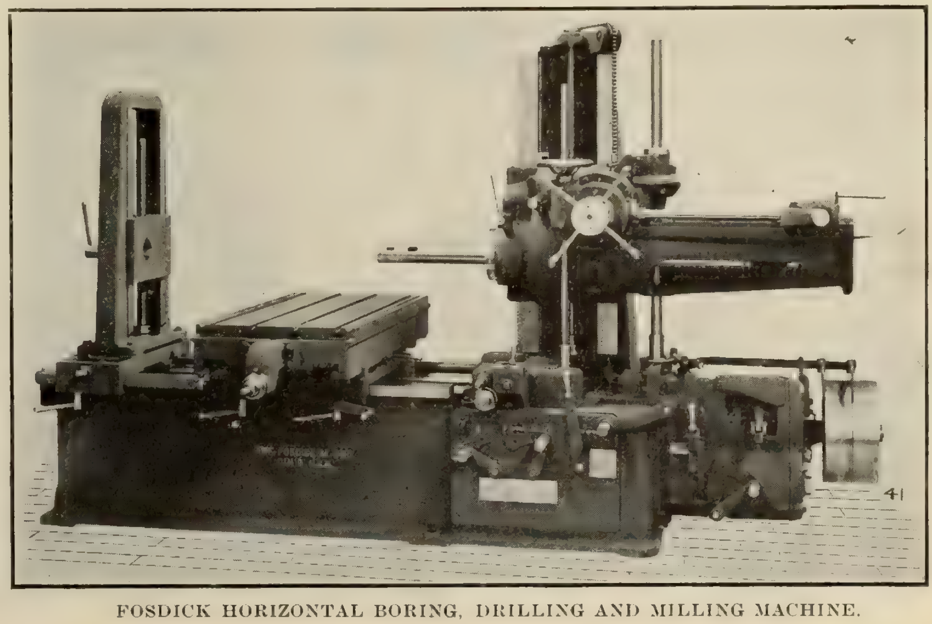
HORIZONTAL BORING DRILLING AND MILLING MACHINE.

THE Fosdick Machine Tool Co., Cincinnati, Ohio, have placed on the market their ney style No. 0 horizontal boring, drilling and milling machine. A perusal of the accompanying details of this specialty will impress one with its up-to-dateness and feature equipment for the particular operations which it is designed to accomplish.

General Design.—In the design of this machine will be found many important improvements, such as centralized control, narrow gibbing surfaces, steel gearing cut with special cutters, bevel gears planed theoretically correct, self-oiling bearings, phosphor bronze bushings, positive hardened clutches, gears and moving parts thoroughly encased, and precision micrometer dials that can be set to zero in any position.

Bed and Column.—The bed is extra deep and well ribbed and thoroughly rigid, which makes the machine self-contained, a foundation unnecessary, and insures perfect alignment. Chip chutes carry the chips and dirt to the rear. The heavy box column has extra wide face and is designed to resist all strains.

Head.—The head and outer support are raised and lowered simultaneously by rapid power traverse, by hand or by the feeds. The elevating screw is suspended from a ball bearing at the top to avoid buckling, and has a steel cable chain to the counterbalance. Automatic safety trips at both extremes are provided.



FOSDICK HORIZONTAL BORING, DRILLING AND MILLING MACHINE.

Spindle.—The spindle is of high carbon crucible steel, accurately ground, and is fitted with Morse taper and cotter keyway. It is driven by two long driving keys, and slides in a sleeve with phosphor bronze bushing tapered to take up the wear. The thrust is taken on a ball bearing. The quick advance and return turnstile is conveniently placed at the front of the head. By a device in the sleeve, the spindle may be held in perfect alignment after any amount of wear.

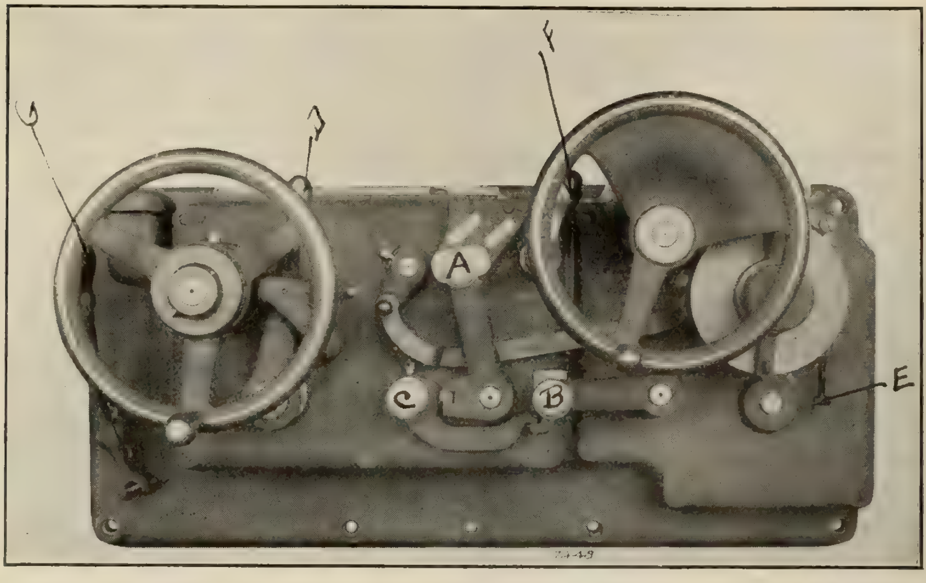


TABLE AND VERTICAL FEED MECHANISM. 22-INCH VERTICAL SURFACE GRINDER.

Table.—The table is of heavy construction, has planed T slots, and is scraped absolutely square with the spindle. It is provided with an oil channel all around, and has automatic safety trips at the extremes.

Feed.—The feed is enclosed, and is composed of all steel slip gears. The changes are made by two handles in front without stopping the machine. A safety friction device adjustable from the outside prevents accidents. The rates of feeds are given on a metal feed plate and are the same for the spindle, table, saddle or head in any direction, and the selection is made by one handle, which makes it impossible to get any but the desired movement. The direction of the feed reverses by reversing the spindle, and stops with the stopping of the latter. An independent feed reverse lever is provided.

Power Rapid Traverse.—Power rapid traverse to all the parts is always in the opposite direction to the feed.

Drive.—The drive is direct, requiring no countershaft, and has direct reading index over the speed changing handle, giving the revolutions per minute of the spindle. A novel overtake clutch keeps the machine running at a reduced speed when making changes, eliminating shock. The reverse mechanism is embodied in the construction, and is operated with a lever in front of the machine. All levers are secured with latches to prevent chattering on heavy work.

Motor Drive.—Motor drive may be added to the machine at any time, and a 5 h.p. constant speed motor of 1,200 to 1,400 r.p.m. may be used.

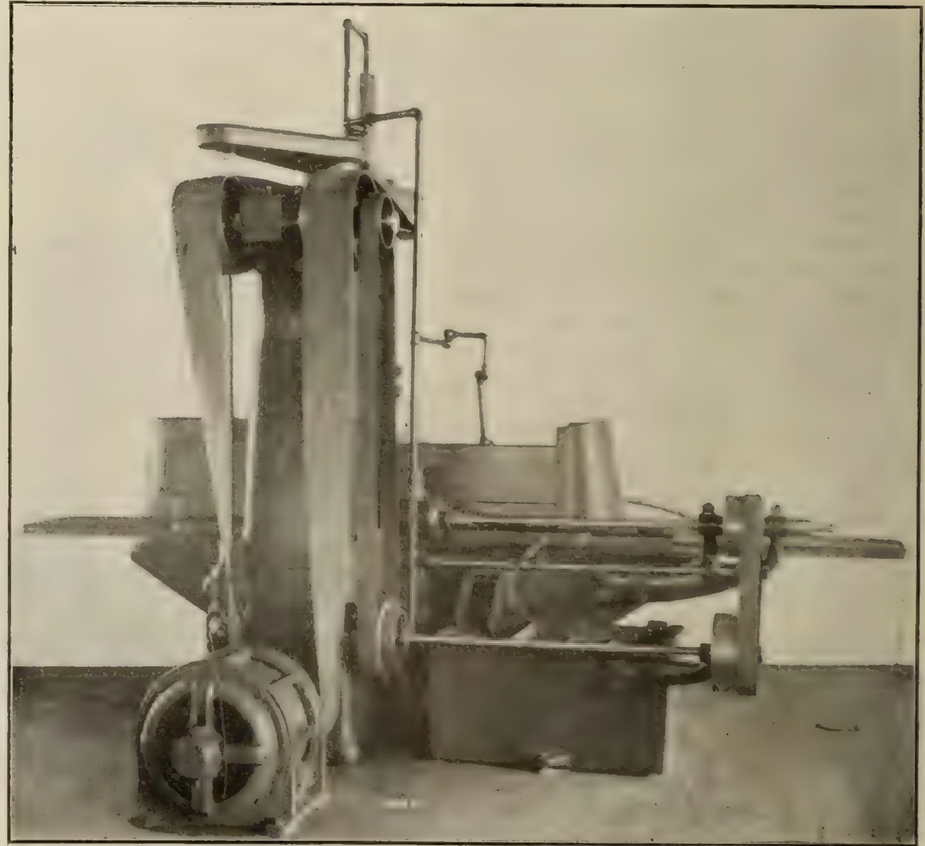
Some Specification Features.

Diameter of spindle bar, 3⅛ in.
Traverse of spindle, 26 in.
Vertical adjustment of head on column, 25½ in.
Maximum distance table to centre of spindle, 26 in.
Cross travel to table, 30 in.
Longitudinal traverse of table, 32 in.
Number of spindle speeds, 16.
Range of spindle speeds, 12-225.
Number of feeds in all directions, 18.
Range of feeds, .004 to .396 in.
Approximate net weight, 8,500 lbs.

22-INCH VERTICAL SURFACE GRINDER.

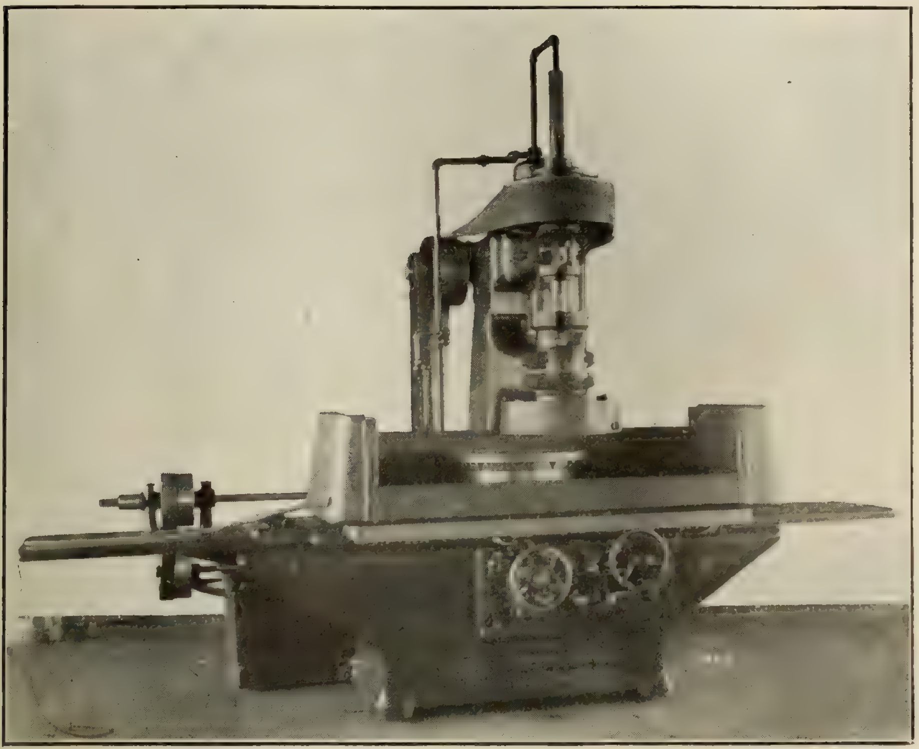
AMONG machines that have influenced modern manufacturing methods, that known as the Pratt & Whitney Vertical Surface Grinder, which has now been on the market several years, takes a leading place. The ability of this type of machine to remove stock rapidly and accurately has practically caused a revolution in manufacturing methods. The unusual results obtained from the smaller machine has led to the development of this larger model for handling work beyond the capacity of the smaller machine. Several of these larger machines have been placed upon the market and the results very carefully observed, which, coupled with a series of tests in the makers' works extending over a year, have conclusively proven that the field for this machine is fully as large, if not larger, than for the smaller size machine.

A distinctive and valuable patented feature to be found in Pratt & Whitney vertical grinders is their ability to handle either plain or circular grinding with the same degree of efficiency. The



22-INCH PRATT & WHITNEY VERTICAL SURFACE GRINDER.

work-holding problem on this type of machine is also greatly simplified as the various appliances, both plain and magnetic, are flexible in application, and may be readily made to accommodate a wide range of work.



22-INCH PRATT & WHITNEY VERTICAL SURFACE GRINDER.

It will be noted that the general appearance of this new machine is very similar to the smaller model, it having been demonstrated that for convenience and accessibility the latter could not be improved upon. In its design is incorporated those required refinements which experience has demonstrated to be essential for this type of machine. It is extremely sensitive and easy to operate, all the various operating requirements being concentrated in one unit within easy reach of the operator.

The bed is provided with wide bearing surfaces of the "V" and "Flat" type, oil reservoirs being located in the bed for the oiling of the ways by means of rolls. The pan which surrounds the rear of the bed for collecting the water and receiving the chips is of liberal proportions and easily accessible for cleaning. The machine may be regularly furnished with either four or seven foot tables, the bed being made in two sizes to accommodate same.

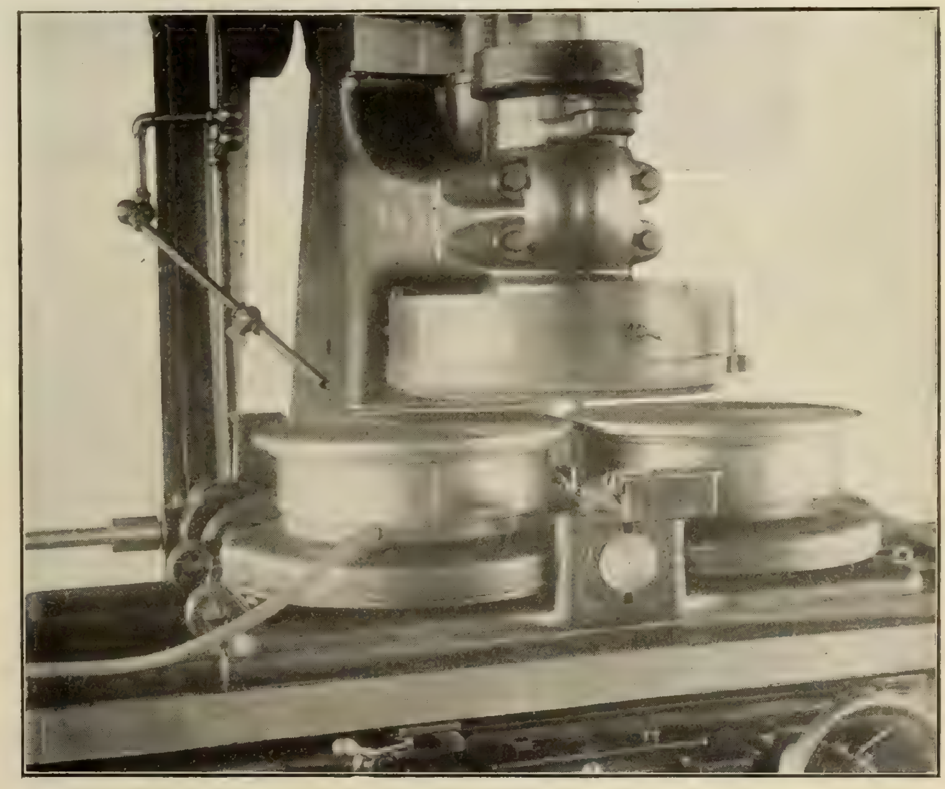
The upright is bolted solid to the bed, wide bearing surfaces being provided for the accommodation of the head. The bearing surfaces are also protected by means of very efficient wipers and guards.

The spindle is made of special steel and of ball bearings construction throughout. This also applies to the driving pulley which is mounted upon ball bearings independent of the spindle. This construction places the driving belt in a protected position away from the water spray, so that it does not lose its efficiency by becoming moist.

The table is provided with automatic reciprocating motion, any desired length of stroke being readily obtainable by means of adjustable table dogs. The feed mechanism is of efficient and substantial construction, it being contained in one compact unit. The table is driven through rack and pinion, vertically located, which construction eliminates the possibility of vibrations, commonly called tooth marks showing in the work. Two table feeds are provided, both of which may be instantly controlled through lever (A). When adjusted to the right station, the slow feed is engaged; the left station in a similar manner engaging the fast feed. This lever when adjusted to the central station also serves as a means for stopping the table.

The table, in addition to the two feeds mentioned, is also provided with power quick return for use in connection with rotary chucks. The power quick return becomes operative and the regular feed inoperative by moving lever (B) to the lower station. It will be noted, however, that lever (B) is locked by means of lock-bolt (C), and cannot be operated while the regular feed is engaged. In order to unlock lever (B), it is necessary that the regular feed lever (A) be in the neutral position, after which the lock-bolt (C) may be adjusted to its outward position, which has the effect of releasing lever (B) and locking lever (A). Thus, it is impossible to engage both the regular and quick return feeds at the same time. After the quick return mechanism has become operative, it is controlled through lever (D).

The wheel is provided with both hand and power feeds in addition to rapid hand feed. The vertical adjustment is



22-INCH PRATT & WHITNEY VERTICAL SURFACE GRINDER.

very sensitive, the head being counterbalanced and accurately controlled through the feed mechanism. The power feed is operated through a ratchet wheel and pawl, the rate of feed being controlled by means of adjusting screw (E). A large micrometer dial for gauging purposes, also an automatic power feed knock-off forms part of the construction. Both regular and rapid hand feeds are controlled through lever (F).

The machine is designed for motor drive only, the method of mounting the motor directly on the floor being clearly shown. Provision has also been made whereby the correct belt angle from the idler to the motor pulley may be always maintained, irrespective of the diameter of the motor pulley. This is accomplished by means of the left hand idler pulley which is so mounted that it may be swivelled to the correct angle, after which it is permanently doweled in place. The size of the motor varies from approximately 20 to 35-h.p., according to the nature of the work for which the machine is to be used.

The machine is provided with a pump of new design which is capable of supplying an abundance of water. One stream of water is carried through the spindle, the centrifugal force of the spindle driving the water between the wheel and the work, keeping both cool and free from dust. The inside stream of water is controlled through lever (G) which is conveniently located on the front of the gear box unit. An outside stream is also provided for conveying water to the outside of the wheel, and for cleansing purposes. The wheel guard also assists in controlling the water. An exceptionally large tank is located on the back of the machine in an accessible position where it may be readily cleaned. The water is returned to the tank without being carried through the pipes; in fact the design is of such a nature throughout as to make the collection of dirt and grit in inaccessible places impossible.

Special attention has been given to the lubricating problems involved; large self-feeding oil reservoirs being provided which insure an ample supply of oil at all times. All bearings are absolutely dust and water proof.

The Pratt & Whitney Co., Hartford, Conn., are the manufacturers of these vertical surface grinders, and the Canadian Fairbanks-Morse Co., Montreal, Toronto, Winnipeg and Vancouver, are the Canadian distributors.

AMERICAN PULLEY CO. PLANT ADDITIONS.

THE American Pulley Co., of Philadelphia, makers of steel split pulleys, have increased their equipment with another big building. The wonderful growth of this concern shows how much can be really done by right business methods. With the American Pulley Co., business has been more than the mere consideration of finding a market for "American" pulleys. The establishing of this market (there are over 2,000,000 "Americans" in service) has been the natural outcome of strict adherence to a well-defined high standard.

There are many other reasons why the "American" steel split pulley is liked. It is correct in principle, and its construction rests upon the most modern methods and most expert workers. Furthermore, the policy maintained by the "American" Company in its relations with its customers and competitors, has always been along the most advanced lines of higher business ethics. A business conducted on these principles, cannot fail to grow, and so this new building, containing 54,000 square feet or about 1¼ acres, became necessary. It will easily store 40,000 belt pulleys; but will also be devoted to the storage of sash pulleys, bushings and all finished products.

While "American" pulleys have always been quickly obtainable, due to the well-stocked branch houses of the Company in Boston, New York and Chicago, and from over a thousand dealers advantageously located throughout the country; this big new storeroom will now make possible larger stocks being carried in Philadelphia of every size of pulley, from 3 inch to 60 inch diameter. Shipments to any point, domestic or foreign, will be greatly facilitated; more efficient service can be rendered to customers; and increased satisfaction for makers and users of "American" pulleys will result.

The entire structure is absolutely fireproof. It has brick walls, tile roof, concrete floors, metal racks, metal bins and shelving, and metal window frames. There is more floor space under this one roof than was occupied by the entire plant when established in Philadelphia, 13 years ago. There will be a second story office 80 ft. x 100 ft., and the office staff will move into its new quarters in October.

AMERICAN PULLEY CO. PLANT, PHILADELPHIA, PA.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

SPIRAL SPRING TESTER.

By A. L. Monrad.

THE fixture here shown was designed for testing short spiral springs of different diameter, and to determine the proper basic constants which depend upon the properties of the wire used. There is such a scarcity of reliable data on spiral springs, their strength and elasticity that it was decided to make a gauge for duplication of model springs. There is loss of time and much expense when buying these goods on the market, singly because they can't be relied upon to give uniformly good results where great accuracy is required.

It is very essential in forming spiral springs to use the very best wire obtainable, and to be sure that there are no flaws in the springs before hardening. Heat sufficiently and drop springs immediately in good substantial fish oil to cool. Hardening in oil requires a slightly higher heat than when water is used, but great care must be taken not to overheat them.

To draw the temper of a spiral spring, place in a ladle or other vessel, cover the springs with fat or oil and heat until the vapor given off ignites. Then discontinue the heating to allow the springs to cool off. To produce a somewhat softer temper, the flame may be allowed to burn itself out two or three times.

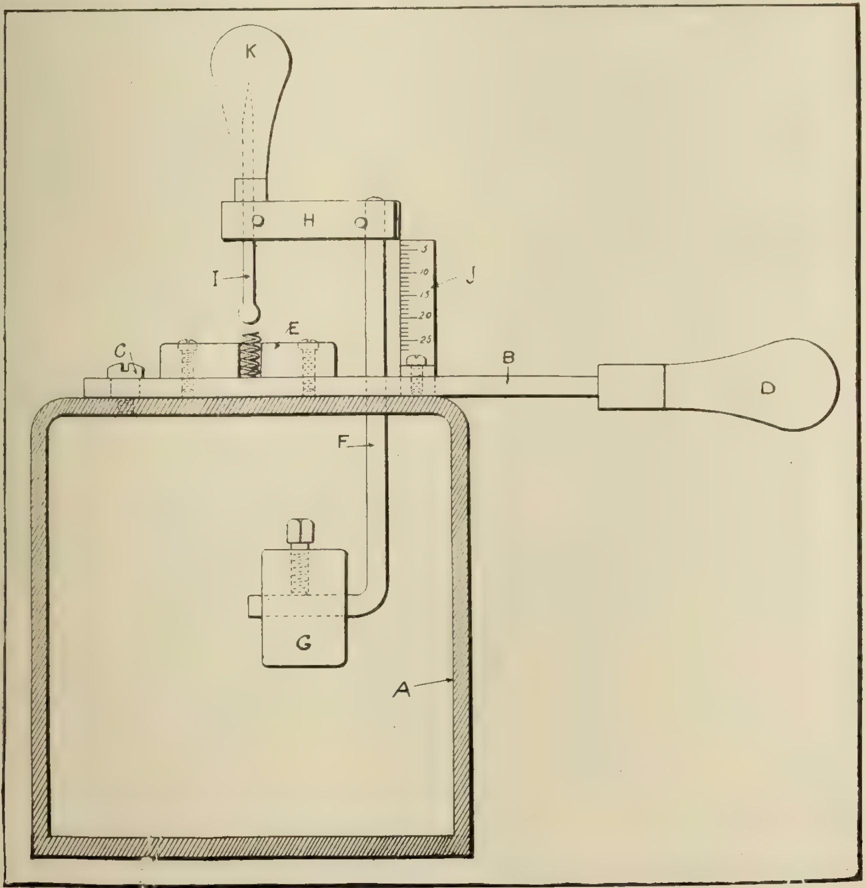
Spring Tester Details.

The spring tester is made as follows: The cast iron box (A) is planed top and bottom, and has a front door, not shown, for the adjustment of weight, etc. On top is located a swinging arm (B) made of machinery steel planed and casehardened. A shoulder screw (C) holds the arm in position. The other end is driven into a good size file handle (D). On top of the arm is held a locating block (E) made of machinery, steel and case hardened, and secured with two cap screws. A hole in its centre is a free fit for the spring to be treated.

To the right hand side of the swinging arm a 5-16 inch hole is drilled in the cast iron box to a free fit for the weight rod (F), and the bottom of the rod is bent to accommodate a 10-lb. cast iron weight (G), which is secured with a set screw. On top end of the rod is driven a steel block (H), which is held with a taper pin on one side. The other end of the block has a round ball wire (I) about the diameter of spiral spring inserted. On the end of this ball wire is driven a file handle to a seat on the block.

A division plate (J) is secured in proper location with two cap screws on top of cast iron box.

Swing the handle (B) with spring in place to its stop at the division plate. Lift the handle (K) up from its cup seat on the cast iron box (not shown) on to the spring to be tested. The slightest variation will then be registered on the division plate. If the spring is too stiff it can easily be corrected by burning the oil off once more but if it is too weak it must be scrapped.



SPIRAL SPRING TESTER.

HINTS FOR YOUNG PATTERNMAKERS.

MAKE your pattern to satisfy the moulder; not your imagination. Imagination is often a cheerful but misleading friend.

A pattern to a moulder is a tool for producing castings; therefore make it as effective as possible.

A "quick" job in the pattern shop may be a slow job in the foundry. It is your job to reduce as much as possible foundry expenditure by producing "workable" patterns.

Pattern experiments at the cost of the foundry are much more interesting when done by "the other fellow."

Don't pity the moulder because he cannot read a drawing. To him it is an advantage, but not a necessity.
bonus, but it may also affect your craft-
bonus, but it may also affect your chaftmanship—disastrously.

Varnish does not produce a smooth surface on the pattern; its object is to resist the effects of moisture. The smooth surface must be obtained first, and requires skill, patience and sharp tools.

A blunt tool is like a nagging woman; it only creates friction without producing any good effect.

Glasspaper is required to finish off the work of the tools, but is not a planing machine. Use it judiciously, for it costs money.

Screws properly driven home are more effective than nails, but require a screw driver, not a hammer. You may think it quicker, until the screw head comes off.

Nails are easily driven in, but often take a lot of getting out, when they may prove to be more costly than a gross of screws. Know when not to use them.

Glue is only a means to an end. Don't depend upon it as the only means to hold a pattern together. Glue in contact with moisture loses its nature, and for some work may prove useless.

Wax is very useful for filling up screw holes, making small fillets, etc., but it is neither necessary nor desirable to form portions of the pattern with this material.

Dowels should be a sliding fit, not "just a bit tight;" this "just a bit tight" may ruin a mould during lifting.

Don't think every young apprentice or "old hand" is a fool. You can learn from both.

You many envy the philanthropist—and you may be one if you will. A word of advice and encouragement to a young apprentice is worth more than gold.—Foundry Trade Journal.

MANUFACTURING A MOTOR CAR ACCESSORY.

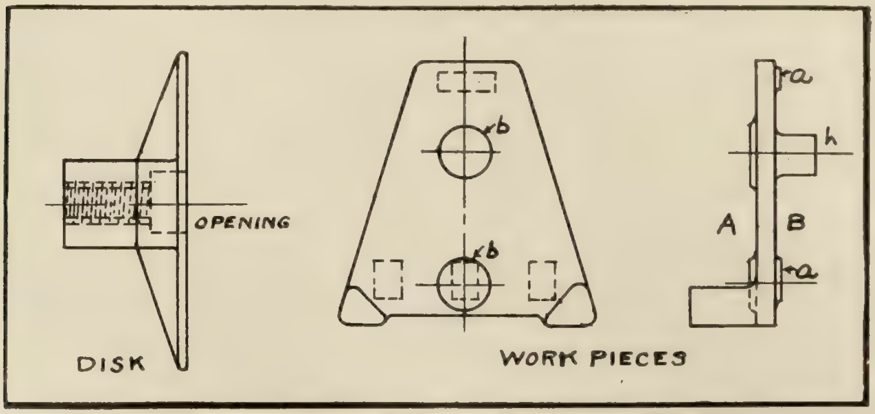
By D. A. Hampson.

OUR shop had taken the contract to make a big lot of a new motor car accessory. One of the pieces going into each unit was the casting shown by the illustration. In the earlier products this casting had been turned on the back side, the side (B). We secured permission to reduce this surface to four finishing spots, which are shown as the four pads (a). On the front side were two round pads (b) which had to be surfaced off at a given distance from (a).

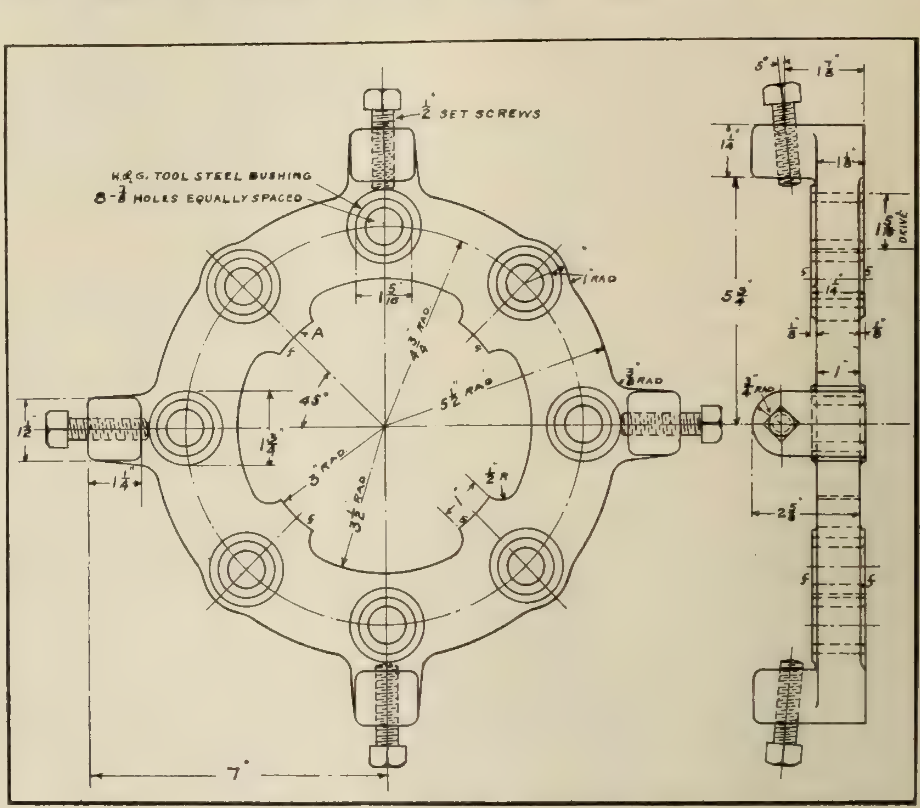
Quite naturally we turned to the disc grinder to do this work, but we met with two interferences—the hub (h) was so placed that the pads (a) could not be finished at one stroke. It was necessary that they should be all in the same plane and of the same height. Further, one of the pads (b) was so located that our discs could not get between the projecting lugs on each side of it. We had discs 12, 14 and 16 inches in diameter.

The writer decided to make special discs for this work and of a diameter small enough for the pad (b) to be reached. Four discs were made as illustrated, and the machine selected for the work was a grinder already speeded up, and which consequently compensated for the decreased size of disc. The spindle of the machine was threaded for flanges and nut, so the discs were threaded likewise. The hubs of the discs were made long enough to give good wearing surface on the threads, and so that when on the machine the end of the spindle was one inch under the disc face.

In this opening the hub of the casting was inserted and the whole four pads surfaced off at one operation. While the boy had the piece in his hand he turned it over and touched off the bosses on the opposite side. The time we saved over any other method more than made up for the cost of the disc wheels.



MANUFACTURING A MOTOR CAR ACCESSORY.



DRILLING JIG FOR FLANGES.

DRILL JIG FOR FLANGES.

By L. E. G.

THE illustration with dimensions shows a simple and efficient jig for drilling flanges used on engine and pump work. The inner edges (A) are bored to the same diameter as the part to be drilled, and are used as a guide in adjusting the fixture, being set flush with the inside diameter or opening of the flange.

The screws are set on an angle of 5 degs., which presses the work against the lower edge of the fixture and prevents the chips from forcing the work and fixture apart.

The jig shown is rather heavy for ordinary use, but made so on account of its use by helpers, who generally imagine anything made of cast iron unbreakable.

* * *

REMINDERS FOR DETAIL DRAFTSMEN.

By E. W. Tate.

A DETAILER should always bear in mind that:

In all places where bolts, studs, cap screws, etc., are used, care should be taken to allow enough room for the use of a standard wrench.

A hexagon nut should always be used wherever the movement of the wrench is limited.

Some means should always be provided for holding bolts from turning while the nuts are being screwed on, if the wrench cannot be used on the head of the bolt.

Bolts, cap screws or nuts, when used in connection with cored holes, should be supplied with washers for providing sufficient bearing surface for the nut or head.

The ribs of a gear should never be made flush with the rim or hub, but should come from ⅛ to ¼ inch below the rim or hub face, for the rim and hub cannot be finished without making an unsightly job.

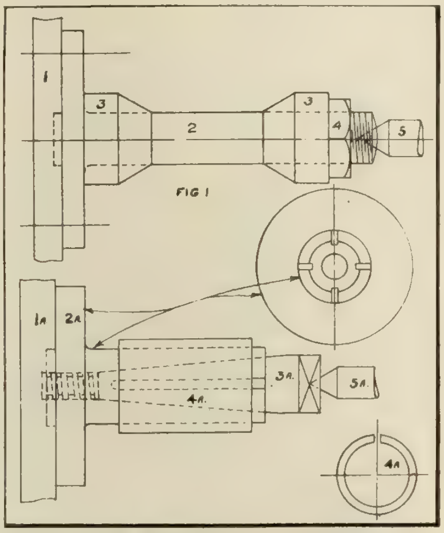
Whenever possible the supporting ribs in castings should be put directly under the load.

When making sub-bases, base plates, pads, etc., for machines, motors, engines or other parts, an allowance of from ⅛ to ¼ inch of planed surface be provided, outside the dimensions of the machine to be attached, for castings can never be depended upon to come true to dimensions, and it always looks a great deal better to have base pads project rather than to be too small.

In selecting the number of teeth in a gear care should be exercised to select only such numbers of teeth as can be cut with the regular indexing gears, as special gears for indexing are not only expensive, but oftentimes cause much delay.

A gib key should not be used to secure a coupling on a shaft. A headless key or feather will be found better.

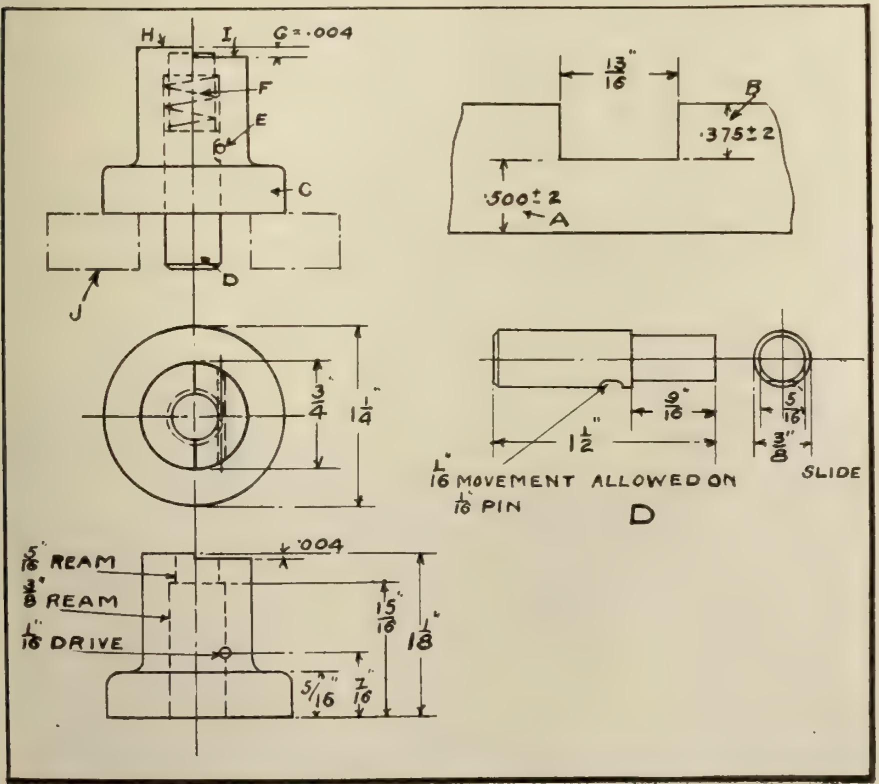
When cold rolled shafting is used, an allowance must be made in the bore, as this shafting will be found to caliper exactly or a trifle over size.



BRASS BUSHING MANDRILLS.

When turned shafting is used, the bore must be standard and the allowance made in the bearing.

Rivets should never be used in direct tension, and that, under such circumstances, bolts and nuts should be used in place of rivets.



A LIMIT DEPTH GAUGE.

BRASS BUSHING MANDRELS.

By H. Womersley.

TWO serviceable mandrels are shown in the accompanying illustrations. That on the cone principle, Fig. 1, will be found highly efficient for brass bushes, care being taken that the cones are a good sliding fit and hardened. (1) represents the face plate; (2) the mandrel spindle, (3) the hardened cones, (4) the adjusting nut, and (5) the loose headstock centre.

The expanding mandrel, Fig. 2, can be used for bushes, collars, etc., and is very effective in gripping the work. (1A) is the face plate, (2A) the mandrel, (3A) the plug, (4A) the split bush, (5A) the centre. The sketches make further explanation unnecessary.

⁂

A LIMIT DEPTH GAUGE.

By J. Baker.

THERE is shown in the accompanying sketches a very convenient limit gauge for gauging the depth of long slots, such as that shown.

It is the general practice to galge the depth of such a slot by a snap gauge placed at the ends of the slot, which does not, however, gauge the depth of the slot directly, but gauges the dimension (A). The advantages of using a gauge such as the one shown, are that the gauge can be applied at any point along the length of the slot, and that the depth is gauged directly, that is, the dimension (B) is gauged, instead of the dimension (A).

The gauge consists of a hardened body, which is drilled, reamed, and counterbored for the hardened flush pin (D). A pin (E) allows the flush pin to move up and down, at the same time keeping it from dropping out, and behind the shoulder of the flush pin is a coiled spring. At (G) at the top of the body, one side is ground off .004 in. lower than the other, as .004 in is the total limit on the depth of the slot.

When the gauge is applied to the slot, the body straddles it, while the flush pin rests on the bottom of the slot, and if the depth of the slot is between the allowable limits, the upper end of the flush pin will be somewhere between the surfaces (H) and (I). If the end of the flush pin is above the surface (H), or below the surface (I), the depth of the slot is not correct. The finger nail is run along (H) and (I), to feel for the end of the flush pin.

After the gauge is assembled, blocks (J) of the same height as the minimum depth of the slot are placed under the body, and the top of the body and flush pin are ground flat. Blocks corresponding to the maximum depth are then placed and one-half of the top of the body is ground flush with the end of pin.

Canadian Furnace Co. Light Up Their Port Colborne Plant

From the standpoint of industrial enterprise, with its necessary accompaniment of confidence in the coming greatness of the Dominion of Canada as a commercial nation, there could have been formed but one opinion by each of the guests of the Canadian Furnace Co. at the lighting-up of their furnace at Port Colborne, Ont., on Saturday last. The function or undertaking was both unique and gigantic, and, perchance, may be parabolic of opportunity and achievement.

THE Canadian Union Furnace Co. became an important factor in the Canadian industrial and manufacturing world, when on Saturday, September 27, with the lighting of the big furnace at its new plant at Port Colborne, Ont., in the presence of between 500 and 600 invited guests, representative of the iron and steel industries in Canada and the United States, operations for the production of merchant pig iron commenced forthwith. The plant is of the most modern and up-to-date type in the matter of layout and equipment, and, when added to this are the ideality of location relative to shipping and railroad facilities and the powerful backing of the parent concern—The Buffalo Union Furnace Co., Buffalo, N.Y., there is abundant and conclusive evidence of a prosperous and steadily developing enterprise.

The Canadian contingent to the inauguration ceremony travelled from Toronto at 8.30 a.m. by special G.T.R. train, consisting of Pacific type locomotive, two baggage cars, 6 day coaches, 2 Pullman sleeping cars, and the private cars of R. S. Logan and J. C. Dalrymple, G.T.R., vice-presidents. The Pullman and private cars carried the Montreal guests who left that city at 10 p.m. the previous (Friday) night. At Hamilton and other points en route to Port Colborne, stoppages were made for the convenience of invited guests from Western Ontario centres. A special train leaving Buffalo at 10 a.m. conveyed those favored with the company's invitation from across the line.

On arrival at Port Colborne, transfer was made from trains to steamer, the Niagara Navigation Co. steamship "Modjeska" having been chartered for a water trip on Lake Erie and through the Welland Canal. The vessel was dressed with flags on her upper deck, masts and rigging, while on the main decks, where the luncheon tables were laid out, every beam was festooned with roses, carnations, dahlias, ferns and smilax. A short water trip lakewards brought the "Modjeska" opposite to the plant, and here disembarkation was made.

The Lighting Up.

On the assembly of the guests in front of the furnace, Mr. Frank Baird, president of the Canadian Furnace Co., called upon Mr. William Weller, chief engineer of the Welland Canal, to blow the work's whistle. The deep and prolonged blast from this important accessory of a factory equipment was the signal for prolonged cheering and a wild outburst of whistledom, as represented by lake and canal craft of every class and kind in Port Colborne Harbor, and by railroad and The Furnace Co. locomotives in the vicinity, as well as by neighboring factories. Following the blowing of the whistle, Miss Teresa Yates, daughter of Mr. Harry Yates, Buffalo, vice-president the Canadian Furnace Co., was presented by Mr. Baird with a sheaf of American Beauty roses.

A specially prepared and decorated torch was next given her, with which she lit the furnace. The successful accomplishment of this function was the signal for another outburst of cheering and whistling, while the band struck up our National Anthem, "God Save the King." This ceremony over, an inspection of the plant was made, after which the guests returned to the "Modjeska." Luncheon was served immediately the vessel cast off, and after a short cruise on Lake Erie, the steamer was put about, and headed for the Welland Canal on a cruise to Thorold.

Congratulatory Speeches.

On conclusion of the luncheon, which was catered for by Coles, of Toronto, and reflected the greatest credit on them, a number of speeches were made suitable to the occasion, and incidentally, but, of course, naturally, complimentary reference was made to Canada's wonderful growth and development, to the steps being taken to improve her commercial and industrial facilities in the matter of railroads, harbors, docks and canals,

PLANT OF THE CANADIAN FURNACE CO., PORT COLBORNE, ONT.

and to the higher and increasing degree of greatness and prosperity that she will yet attain to, and which possibly, meantime, we fail to realize fully.

EQUIPMENT FEATURE, CANADIAN FURNACE CO. PLANT, PORT COLBORNE, ONT.

Mr. Frederic Nichols, of Toronto, President of the Canadian General Electric Co., and Mr. R. S. Logan, Vice-President of the Grand Trunk, in response to toasts, spoke for the most part about the great corporations which they represent. Mr. E. H. Butler, of Buffalo, spoke very highly of Canadian enterprise and the spirit of co-operation, which, he declared, is responsible for the rapid development of the Dominion, commercially, agriculturally and industrially.

A Few of the Guests.

Those present included: Frank B. Baird, President of the Buffalo Union Furnace Co. and its Canadian Subsidiary; Harry Yates, First Vice-President and Treasurer; Justice Herbert P. Bissell; Bishop Charles A. Colton; Frederic Nichols, Toronto; William Weller and Robt. Bowden, engineers in charge of the Welland Canal; John Cook, Reeve of Port Colborne; J. J. Albright, S. H. Knox, John Lord O'Brien, H. T. Ramsdell, Edmund Hayes, E. H. Butler, Franklin B. Richards, of Cleveland; Noel Marshall, of Toronto; W. L. Ireland, Montreal; William Fitzsimmons, Montreal; J. E. Dalrymple, Montreal; R. S. Logan, Montreal; W. H. Whittenberger, Montreal; H. C. Martin, Montreal; G. T. Bell, Montreal; C. E. Dewey, Montreal; Harry Morgan, Montreal; H. R. Charlton, Montreal; Col. J. B. MacLean, Toronto; William MacNab, Montreal; Richard Bradshaw, Toronto; Robt. Hobson, Hamilton; Peter Bain, Editor "Canadian Machinery," Toronto.

A large number of ladies from both the Canadian and American sides participated in the hospitality of the Furnace Company, while a mead of praise is due the Band of the 19th Battalion, St. Catharines, Ont., which discoursed pleasing and select music at frequent intervals during the trip on the water.

The Homecoming.

On arrival of the "Modjeska" at Thorold, about 5 p.m., transfer was again made, this time to the respective trains, which were in waiting. Buffalo and Toronto were reached at 7 p.m. and 7.30 p.m., respectively, and an invitation dinner dispensed in a number of G.T.R. dining cars at the Union Station, Toronto, made a fitting climax to a day in almost every respect unparalleled in the history of commercial and industrial Canada. The weather was ideal, the Grand Trunk Railway lived up to and possibly excelled its previously high reputation as a transportation caterer, while of "Mine Host," be it said, they certainly laid plans to dispense hospitality with a lavish hand, and in return signalized their entry into the sphere of Canadian manufacture by a huge, impressive and effective advertisement.

Equipment Features.

A few items of the plant equipment features noted, in addition to the furnace proper and its feed apparatus, were the 2 powerful vertical type blowing engines, built by the Allis-Chalmers Co., Milwaukee, Wis.; 2 Curtis steam turbines, direct connected to General Electric Co., generators of 300 k.w., 1,200 amp., 250 volts, 1,800 r.p.m.; 2 powerful Worthington boiler feed pumps; Cochrane feed water heater; General Electric Co. switchboard, and 8 vertical water tube boilers, built by Wickes Bros., Saginaw, Mich.

TIN STATISTICS.

THE August statistics published by Ricard and Friewald, of 120 Fenchurch street, E.C., show that the total visible supply of tin in stock and afloat on August 31 was 11,860 tons. This figure compares with 12,967 tons a month earlier, and 11,857 tons a year earlier. Of these totals, the proportions for the United Kingdom were 6,415 tons on August 31, 5,715 tons on July 31, and 5,819 tons on August 31, 1912. The total monthly supplies for the same dates were 6,381 tons, 7,794 tons, and 5,746 tons, while the corresponding monthly deliveries were 7,488 tons, 6,937 tons, and 7,799 tons.

The supplies from the Straits Settlements and Australia, which are included in the above figures, were 62,062 tons from the former between September 1, 1912, and August 31, 1913, and 3,405 tons in the same time from Australia. Supplies not included in the above statistics were 21,169 tons from Bolivia to Europe in 1912, and 8,644 tons from China to all ports in the same year. The Cornish production for 1912 is estimated at 4,900 tons, while the Transvaal production for the same period was 1,845 tons.

THE ADVENT OF THE CANADIAN FURNACE COMPANY.

THE advent of the Canadian Furnace Co. as a producer of pig iron within our borders is of more than passing moment at present, in view of the fact that the Canada Iron Corporation, a large industrial enterprise operating along similar lines, has just recently gone into liquidation. The Canadian Manufacturer's Association Convention, held a few weeks ago in Halifax, Nova Scotia, gave unmistakable indication of dissatisfaction with the position of and outlook for the iron and steel trade generally in Canada, and expression, active and passive, freely and effectively disbursed, relative to Government aid in the matter, showed in no uncertain way that a large measure of protection through a tariff medium was keenly desired.

In another section of this issue, a few details are given concerning the steps taken by this new enterprise to inaugurate and mark their establishment on our shores. To the man on the street, who simply forms his ideas from what he reads in the daily or technical press of the going down or coming up of this, that or the other industrial enterprise, the advent of the Canadian Furnace Co. is a proceeding which makes him stop and ponder. He is, however, almost wholly on the outside of the wheel. The why and wherefore of the Canadian Furnace Co., to those nearer the hub of wheel, and who take a keener interest in events and conditions, and who may, perchance, be able to make a more scientific analysis, arouses a curious inquisitiveness as to the wisdom of the step taken, followed, however, by the natural conclusion that those financially concerned must have counted the cost, and must be possessed of at least ordinary intelligence.

Again, what shall we say of those belonging to the latter class, who were privileged to be present at the furnace lighting ceremony on Saturday last at Port Colborne. Men on the outside of wheel, yes, all the way to the very hub centre, were there, and all, without exception, admitted that a $5,000, one-day advertisement was no fool play. The individuals behind the Canadian Furnace Co. by their action and display last Saturday, gave intimation to all concerned, competitor and customer alike in this Dominion of Canada that they had started business, and having done so, meant to make it go.

The occasion will be a memorable one, tending as it does and will do to considerable speculation, and accentuating what was previously a not too clearly defined nor exactly determined situation. The old questions of tariff, bounty, capitalization, and management have been given an added fillip, and it is not assuming too much when we say, that in the light of the recent happenings, the two latter, capitalization and management, will be looked upon as a not unreasonable solution of the new conditions which have arisen.

An ominous silence is generally observable, relative not only to the recent function at Port Colborne, but to the place and part which the Company will fill and play in the industrial and manufacturing life of Canada. What the Canadian Furnace Co. have set out to accomplish will not, however, be stayed one iota on that account, and if they can show us a few things and teach us a few lessons, we have everything to gain and nothing to lose by their advent to our shores.

◆

THE exceedingly optimistic address of Mr. R. S. Gourlay, the ex-president of the Canadian Manufacturers' Association, is a surprise to some of his associates in the piano business, for it is understood that piano men generally have experienced a very quiet time for some months. Nevertheless, Mr. Gourlay has vision enough to recognize that conditions generally look bright.

◆

TO the strong hand and strong head, the capacious lungs and vigorous frame, fall, and will always fall, the heavy burdens; and where the heavy burdens fall, the great prizes fall too.—The Laws of Life.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Sept. 29, 1913.—The improvement in the machinery trade that was hoped for this week failed to materialize, and conditions remain very quiet in the heavy lines, though there is some demand for light tools, mill supplies, etc. However, in view of the plant extensions now being made at the Montreal Locomotive Works and the Angus shops of the Canadian Pacific Railway, it is probable that some good railway orders will be booked in the near future.

Though money is still tight and collections from the North-West slow, general trade conditions show a decided improvement as a result of the assured success of the Western harvest. The banks are showing more inclination to accommodate parties seeking commercial loans than they were a few weeks ago.

Pig Iron, Copper, etc.

Prices of English pig remain unchanged from last week's figures. There has been a good demand during the week, and some nice orders have been booked. Good business is also being done in moulding sand and foundry supplies generally.

The copper market is still inclined to be dull. Prices remain high, but very little business is offering. Tin is down 50 cents a ton, contrary to expectations. It usually advances after the Banca sale, which took place on September 26, but on this occasion for some reason, difficult to explain, the price dropped back.

Toronto, Ont., Sept. 29.—The situation in the iron and steel market remains much as it was last week. The predicted reductions in price have not yet taken place. Trading is a little brisker. The lighting of the new furnace of the Canadian Furnace Co. at Port Colborne, Ont., introduces a new element into the pig iron situation in Canada. Already some big orders for pig iron have been placed. The price in Canada as in the United States is tending upwards. The Steel Company of Canada are asking $19.05 this week. The encroaching of outside companies into the Ontario market is having its effect on prices. The keen competition caused by the efforts of a Nova Scotian company in Toronto has caused the price of smooth steel wire, No. 6-9 gauge, to drop to $2.20 base, whereas it was $2.35 a week ago. This price has been adopted by other Canadian companies to meet these conditions. Heavy copper wire is advancing in price. It is now selling at $19 base, whereas during the last few weeks the price has varied around $17.50 and $18.50. On the whole, the wire business is fair for this time of the year. Manufacturers are showing little disposition to buy new stocks.

Machine Tools.

The Canadian Fairbanks Morse Co. are ahead in their sales for September compared with the corresponding month of last year. They report the engine business exceedingly good, as well as the scale trade, but machine tools are still quiet. There is some doubt yet as to who will secure the big order for machine tools for the new plant of the Abitibi Pulp and Paper Co. of Iroquois Falls, Ont. It was reported definitely some weeks ago that this order had been let, though it seems that there is nothing certain in the matter.

There is no change in the price of metals this week, and business is reported as next to nothing.

St. John, N.B., Sept. 29, 1913.—From present indications it would seem that the prolonged lumber mill strike, in which eight large plants, employing several hundred men, have lain idle for many weeks, is about at an end. The men have almost decided to return to work under the old conditions with the same wage scale. Some of the plants have already resumed operations, while others are expected to follow in a short time. The strike has had a telling effect upon many other industries, and will seriously lessen the volume of trade in the port of St. John this year.

It is reported from what seems most reliable authority that plans for the development of the immense water power at Grand Falls, N.B., are being rapidly completed, whereby the International Paper Co. will acquire the interests of the Grand Falls Power Co. The power at these Falls is said to be second to Niagara in the East. Engineers say they are capable of producing in excess of 80,000 h.p., and the plans call for the erection of a pulp and paper plant, which will mean an expenditure of about $2,500,000. The matter of the development of the Falls has been referred to the International St. John River Commission, and before actual work can be commenced there will probably have to be an adjustment of some matters between the United States and Great Britain.

A new marine wharf and depot has been started in St. John under the direction of the Department of Marine. The wharf will be the first to be built of concrete in this harbor, while the whole depot will be entirely modern and up-to-date.

H. T. Hoag, secretary of the Board of Trade, leaves this week for New York to attend a large exhibition being held there, at which he intends interviewing manufacturers of industrial exhibits regarding the possibility of their making St. John a site for a branch of their industry. He has been in communication with some of them already concerning the matter, and has received replies that seem most favorable.

The Government dredging operations at Courtenay Bay under contract with Norton Griffiths, Ltd., of London, Eng., will be pushed ahead rapidly from this date forward, through the arrival here of one of the most modern dredges afloat, the "Don Frederico," which has been brought from the Old Country under her own steam, and the coming of another, the "Scotland," which will soon arrive.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Rossthern, Sask.—Fire recently destroyed the machine shop of Philip Kenzel. Loss, $5,000.

Portage La Prairie, Man.—Wm. Richardson, president of the Portage Development Co., announces that an American firm making road graders, grain elevators, etc., will move their Canadian warehouse from Winnipeg to Portage.

Sydney, N.S.—R. I. Evans, secretary of the Board of Trade, has received a letter from Morgan L. Jones & Co., mining and tin plate machinery manufacturers, asking whether their industry could be safeguarded if they built a branch plant in Sydney.

Transcona, Man.—Mayor Deacon, of Winnipeg, managing director of the Manitoba Bridge and Iron Works Co., announces that his company will build a plant costing $2,000,000, employing 1,000 hands in Transcona, as soon as financial conditions permit. Plans have been prepared, and a site purchased.

Midland, Ont. — The ratepayers of Midland will vote shortly on a proposition to lend $60,000 to Edward John Vanderboom, of Milwaukee, Wis., for the establishment of a malleable iron works. The plant will be a one-storey reinforced concrete building 30 x 500 ft., with an addition of 20 x 310 feet, which will be in operation on July 1, 1914, and will cost $100,000. Electric power will be used throughout.

Gananoque, Ont.—The new shovel rolling mill, which has been in the course of construction for a year past, was started up on Sept. 18, rolling shovel "blanks." Finishing equipment to take care of this enlarged rolling mill output is now being installed, and when all is completed (probably in a month or six weeks' time), the Shovel Co. will produce 100 dozen a day more than formerly. This is one of the companies taken over by the recently organized Ontario Shovel Products Co.

London, Ont. — The London Foundry Co. has been taken over by a number of Montreal and St. Catharines capitalists, and will be enlarged considerably. The final transfer of the stock took place Sept. 28, and the new company formed, with the following officers: President and Managing Director, Ernest Grobbe, St. Catharines; Directors, William P. Kearney, Montreal; Fred W. McLean, St. Catharines; David J. Cowan and Joshua Garratt, London. The firm will manufacture hardware supplies, automobile parts, etc. Within a year it is expected that 100 men will be employed.

Electrical

Rainy River, Ont. — New equipment has been purchased for the power house here.

Prince Albert, Sask.—The ratepayers have authorized the expenditure of $275,000 for a new steam power plant.

Ottawa, Ont.—Three new wireless stations are being completed at Port Burwell, Lake Erie, and Toronto and Kingston, which will make a complete chain of wireless stations from Port Arthur through the Great Lakes and along the St. Lawrence to Cape Race, a distance of 2,000 miles.

Welland, Ont.— Another 60,000 volt line has been started from Niagara Falls for the use of the Welland Hydro-Electire Commission. It has a capacity of 50,000 h.p., of which 25,000 horse-power has been sold to the Carbide Works and Turnbull's electric steel works, which are just beginning to erect plants here.

St. Thomas, Ont.—The Michigan Central Railroad signed a contract with the City of St. Thomas on Sept. 24 to use Hydro-Electric. The road agrees to take 670 horse-power, with the privilege of using 1,200 horse-power. It is expected when the company have their new shops completed, that they will be using 1,000 horse-power. The city is now negotiating with the Pere Marquette Railroad for a contract.

Blue Prints of Hydro Routes.— Blue prints of the three possible routes for the proposed Hydro-electric radials, have been sent to the municipalities interested. It is generally conceded that the choice lies between two of these, both of which start in the neighborhood of Norway and Doncaster, and proceed in a northeasterly direction from east of the Don river. Both lines converge at Unionville, and it is in the stretch before this point is reached that the main difference in the layout occurs. From this point the lines run to Markham, and dividing, one branch turns northward to Stouffville and Uxbridge, while the other runs east, making connection with a spur line from Whitby Junction, and concluding in Port Perry.

Railways—Bridges

Winnipeg, Man.—Track laying on the main line of the G.T.P. railway is proceeding towards Prince George at a rapid rate. Steel is now at mile 1,200 from Winnepg.

Toronto, Ont.—An important announcement affecting the future of the Timiskaming and Northern Ontario Railway is made by J. L. Englehart, chairman of the Commission. It is proposed to electrify the Kerr Lake branch next spring and make it part of the Nipissing Central service.

London, Ont.—Activities of the new steam line that is to be built from Lake Erie to London by the Canadian Stewart Construction Co., have been transferred to London. For the past week, Engineer S. Wilson, the representative of the construction company, who has been in charge of the surveys that have been run into London, has been at work in the assessment department, making drawings.

St. Catharines, Ont. — A conference between the St. Catharines city council and Martin N. Todd, of the C.P.R., resulted in terms being tentatively agreed upon for the beginning of the construction of the proposed fast electric line between Hamilton and St. Catharines by the C.P.R., six months after a by-law is passed by the ratepayers of that city granting $100,000 towards the cost of bridging the big gully of the old Welland canal at the entrance to St. Catharines.

General Industrial

Montreal, P.Q.—The Martin-Senour Co., 655 Drolet Street, will erect a paint factory to cost about $90,000.

Vancouver, B.C.—The American Can Co. will start work soon on a new $75,000 factory. It will be three storeys high.

Montreal, P.Q.—The Dominion Oilcloth Co., St. Catharines Street East, has awarded the contract for an addition to its factory, to cost about $30,000.

Perth, Ont.—Fire damaged the factory of the Perth Felt Co. on Sept 22 to the extent of nearly $20,000 dollars. The company is rushed with work, and was ready to equip a large brick addition which was only recently erected.

Toronto, Ont.—Permits for an addition to the Gendron Co.'s factory, Duchess and Ontario Streets, to cost $8,000, and for alterations to the Merchants' Bank on Parliament, near Gerrard, $9,000, were granted on Sept. 26.

Wilberforce, Ont.—The Tonkin du Pont Graphite Co. is having plans prepared for a factory for the refining of graphite, which will be erected here at an estimated cost of $125,000 for buildings and equipment. H. G. Tonkin is manager.

Water-Works

Galt, Ont.—The new dam of the Galt Gas & Light Co. across the Grand River was completed last week.

Montreal, P.Q.—Montreal's new $3,000,000 filtration plant is not large enough, and within twelve months at the latest another $1,000,000 or more will have to be spent on the work in order that it may meet the requirements of the city.

Municipal

London, Ont.—At a special meeting of the City Council, held Sept. 24, it was decided to submit the by-law to raise $700,000 for the electrification of the London and Port Stanley Railway on October 16th. At the same time the electors will be asked to raise $400,000 for storm sewers.

Refrigeration

Saskatoon, Sask.—The Saskatchewan Abattoirs, Ltd., capitalized at $200,000, will shortly erect a plant.

Winnipeg, Man.—The Board of Control has awarded the contract for the construction of a refrigeration plant, to cost about $12,000.

St. John's, Nfld. — Two Norwegian gentlemen were here recently to establish a refrigerating plant, with the intention of exporting halibut, salmon and eels.

Wood-Working

Penticton, B.C.—The sawmill of the Irwin Wright Lumber Co. was burned recently, and much of the machinery was rendered useless. The plant will be rebuilt at once.

Montreal, Que.—J. S. Russell, architect, is preparing plans for the erection of a factory for the Farquharson Co., Montreal, for the manufacture of upholstering supplies. The cost has been estimated at about $35,000.

Magog, Que.—Messrs. Martin & Wallace have just installed in their sash and door factory the latest type of a combination matcher, moulder and planer. Martin & Wallace are rapidly equipping their shop with a complete outfit of modern machinery.

Contracts Awarded

Winnipeg, Man.—The Imperial Wire & Cable Co., Montreal, received an order recently from the City of Winnipeg, for 12,000 ft. paper insulated lead covered underground cable.

Toronto, Ont.—A contract has been awarded the Imperial Wire & Cable Co., Montreal, by the Toronto Hydro-Electric System for approximately 22,000 ft. of 2 and 3 conductor paper insulated lead covered underground cable and conductors ranging from No. 6 B. & S. to 500,000 C.M.

Calgary, Alta.—The City of Calgary have recently placed an order with the

The New Force in Business

SPEAKING before the Eighth Annual Convention of the Trade Press Association, Hotel Astor, New York, Mr. R. R. Shuman, of the Shuman-Booth Company, Chicago, eulogized the trade and technical press in no uncertain tones.

Mr. Shuman is an authority on the subject of advertising, and his opinion of trade and technical papers is well worth reading. It will be gratifying to those progressive men, who have already thrown their lot in with the class journal, and it should be encouraging to those who hesitate on the border line of indecision.

Mr. Shuman said many things well worth reading, but space permits our quoting only two or three. However, there's enough in what we give to keep you thinking for a while.

"It is with a feeling of respect almost akin to awe that I presume to stand up before this audience of the leading publishers of trade and technical media . . . for I realize, as perhaps but few of you individually realizes the power which lies in your hands. And it is this power, this new force in business about which I shall speak.

As periodical visitors to the desks, to the mind and the hearts of the captains of trade and industry of this nation you yield a power far greater than that of the political press, greater than that of the pulpit, greater than any other publicity force that now exists in this or any other country, for the pupils who sit at your feet are not the idle, the thoughtless multitude, but are that great great masterful 5 per cent. of the population of this country who control the labor or market the products of the other 95 per cent. Your pupils are the men who have built and are building America's industrial and commercial greatness, and your instruction given with so lavish a hand, has, I firmly believe, done more to put America in the forefront of the commercial and industrial nations of the earth than any other one influence.

* * * * * * *

To give an index of the power of the technical journals, it is only necessary to study into the equipment and methods prevailing in manufacturing plants of to-day compared with those of only a very few years ago.

Science and up-to-date efficiency engineering have taken the place of the rule of thumb in manufacture. The printed word has vastly simplified and facilitated the solution of problems of securing first hand distribution of the products made.

* * * * * * *

The class journals, those concerned with both manufacturing and merchandising—the journals zealously devoted to specialized fields of endeavor have become powers in those fields in direct proportion to the intelligence and unselfishness with which they build for others while they build for themselves.

In both the avenues of trade and of industry the periodicals which you publish give to every subscriber the benefit of the latest thought, the latest development of machine or method which the most powerful organizations of the country have been able to devise.

The time was when a few manufacturers or merchants could control at least a partial monopoly of the shortcuts and efficiency plans which they had developed or adopted, but that time has gone and the brains of each, the creations of each, the efficiency-developments of each, become, through you, the property of all.

Your editorial pages give freely information which cost you or which cost others, vast sums of money.

Your advertising pages thrill with messages of betterment in appliance or in merchandise. And more and more the subscribers to trade and technical and class journals are coming to read the advertising pages of those journals with a care which is a true index of their valuation of the importance to them of those advertised messages.

"And more and more the subscribers to trade and technical and class journals are coming to read the advertising pages."

You bet they are!

Trade Gossip

Can. Crocker-Wheeler Co.—The contract has been let to the Canadian Crocker Wheeler Co., of St. Catharines, Ont., for motors and electric apparatus for the G.T.P. shops Transcona. The contract price is $26,500.

The Hawley Down Draft Furnace Co., Eastern Pa., recently shipped to the Canadian Westinghouse Co., for their plant at Hamilton, Ont., a large Hawley-Schwartz metal melting furnace, which is additional equipment to the furnaces this company is already operating. The parent Westinghouse plants in the United States have used these furnaces for a number of years.

Foundrymen's Convention and Exhibition.—The Vulcan Engineering Sales Co., Chicago, advise us that they propose to exhibit between 40 and 50 tons of machinery and appliances at the above convention and exhibition in Chicago, from October 10 to 17, the greater portion of which will consist of machines in operation. Messrs. E. H. Mumford, James T. Lee, J. T. Georgeson, T. J. Mumford, Carl Falk, W. H. Huelster, A. B. Caleen and David M. Whyte will be in attendance. The Mumford Molding Machine Co. will be represented by plain jolt ramming machines, electric cam jolter, pattern drawing mechanisms, power and hand squeezers, split pattern machines, hand and knee valves, vibrators and blow valves; the Q.M.S. Company by steel foundry cold metal saw, cut-off type cold metal saw, bar cutting cold metal saw, hack saws (three sizes), automatic saw grinder, cranes, trolleys and hoists; the

The Way to the Job Higher Up

The manager of the largest concern of its kind in Canada recently gave our circulation representative a pass and permission to interview members of their mechanical staff.

This was done because the manager realized that the man who reads his technical paper is more efficient than the man who doesn't.

And the efficient man is the best paid, the most ambitious, and in the end is found at the top of the ladder.

Study your paper carefully and apply the knowledge in your daily work. Keep your subscription renewed so that you will not miss one issue.

The date on the label of your wrapper shows when your subscription expires. **Less than four cents per copy**—two dollars a year—will renew it. Do it promptly in your own interest.

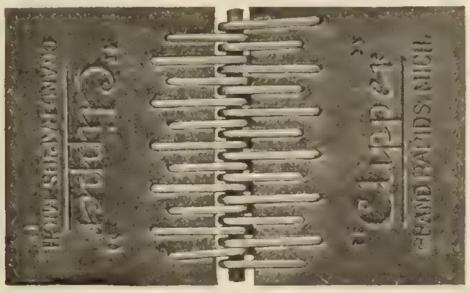
and the Clipper lacing will be full as durable as the rawhide lacing.

The Clipper lacing is more flexible than the belt itself.

The Clipper sinks the hooks deep into the material, flush on both sides. This means that you get the full tractional efficiency of the belt, instead of losing 80% of its contact-surface at the lacing, as you do when protuberances and knots of rawhide lacing lift the belt from the pulleys.



When a belt gives way the boy in charge of the Clipper runs to the belt with this small, compact 19-lb. machine, sinks the whole row of hooks (at one operation) into each belt end, stretches the belt over the lower pulley, inserts a Fibro pin through the intermeshed hooks and the job is done.

Free Trial Offer

We have authorized our Canadian dealers to ship or deliver a No. 2 Clipper Belt Lacer and 3 boxes of Clipper hooks to any responsible manufacturer for 30 days' free trial. At the end of that period you have the option of returning the machine and unused hooks, or paying for them. No charge is made for the hooks used for the trial purposes.

Prices

Following are the standard net retail prices in Canada, duty paid:

No. 2 Clipper Machine	$20.00
3 Boxes of hooks, 3 sizes	6.25

Each box contains 27 cards of 37 hooks each, or enough to lace 84 inches of belt width both ends.

Send for our booklet.

Personal

Thos. Garlock, Jun., Peterkin Building, Toronto, has been appointed sales agent for the American Wood Working Machinery Co., Rochester, N.Y.

Sir George and Lady Armstrong, accompanied by Sir Henry and Lady Pellatt, visited the plant of the Dominion Iron and Steel Co., Sydney, on Tuesday, Sept. 23.

Jens Orten Boving in a letter to J. S. Flavelle, Lindsay, Ont., announces that plans are ready, and four men from the Swedish works of the Boving Co., will be sent to prepare for building the new plant at Lindsay.

Sir Alexander Binnie, a member of many scientific institutions, who constructed the Blackwall Tunnell and the Nagpore Waterworks, and who was at one time chief engineer to the London County Council, and more recently was engaged to report on the water supply of Ottawa, Ont., has had the misfortune to lose a leg, which had to be amputated in consequence of arterial trouble.

Bert Wismer, of the Massey-Harris Co. travelling staff, has returned from a business trip to Russia in the interests of his Company, which does a very large business in Russia. Conditions there for Canadian agricultural implements are very good, and it is expected that the local concern will benefit accordingly. Mr. Wismer returned by way of Siberia over the Transcontinental Railway and on to Canada by the steamer Oceanic.

H. W. Curling has been appointed managing director of the Canadian Union Electric Co., Toronto. Mr. Curling has been connected with The Union Electric Co. of London, Eng., since 1905, and spent three years in South Africa in their interest, during which time he engineered, among others, the following contracts:—The total installation of plant and transmission line at Roodepoort and Maraisburg; the electrical plant installation in workshops of South African railways, and the light, heat, and power plant for the Randt Daily Mail, Johannesburg's leading newspaper. The Canadian Union Electric Co. headquarters will be on Wellington Street W., Toronto, and branches will be opened in several important cities.

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers. We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.

We can finish steel stampings in Nickel, Brass or Copper.

Send us a sample order.

"Detroit" Twist Drills

Test them on a tough job—**See** for yourself how rapidly they cut; **see** how long they stay sharp; **see** how accurate they are.

Let a test prove to you that they possess the four factors essential to accuracy and greatest capacity for work.

1—Both cutting lips have the same inclination to the axis.
2—Both cutting lips are equal.
2—Proper contour of the surface back of the cutting edge.
4—Proper angle of lip clearance.

It Will Be To Your Interest To Attend The

Foundry and Machine Exhibition

International Amphitheatre, CHICAGO, OCTOBER, 10-17

Classification of Exhibits

Abrasive materials.
Adding machines.
Air compressors.
Belt lacing machines.
Blastmeters.
Blowers, cupola.
Boring machines, vertical.
Boring machines, horizontal.
Boring mills.
Broaching machines.
Carborundum products.
Cars, industrial.
Chain blocks.
Chucks, drill.
Chucks, lathe and planer.
Clutches, friction.
Controllers, electric.
Converters, steel.
Core machines.
Core ovens.
Cranes, electric.
Crucibles, retorts, etc
Cupolas.
Cutters, gear and milling.
Cutting-off machines and tools.
Cutting, oxy-acetylene.
Drill grinding machinery.
Drill presses, multiple spindle.
Drilling machines.
Drills.
Drills, radial.
Dust collectors.
Dynamos.
Electrical supplies.
Electro-plating machinery.
Electro-platers' supplies.
Elevators, electric.
Fans, electric and exhaust.
Factory construction material.
Fire-brick, cupola block.
Flasks, aluminum, iron, wood.
Foundry equipment, iron, brass.
Foundry supplies, etc.
Furnaces, melting.
Furnaces, annealing and tempering.
Furnaces, electric.
Gear cutting machines.
Gear hobbers.
Graphite.
Grinding tools.
Grinding wheels, alundum.
Grinding wheels, carborundum.
Grinding and polishing machinery.
Grinders, disc and surface.
Grinders, plain and universal.
Hack saw machines, power.
Hoisting and conveying machinery.
Hoists, electric, pneumatic.
Hoists, portable.
Ingot metals.
Keyseaters.
Ladle heaters.
Lathes, engine and turret.
Lathes, wood and pattern.
Lubricants.
Mch. shop tools, supplies.
Matchplates.
Milling machines, horizontal and vertical.
Mold dryers.
Molding machines, automatic.
Molding machines, hand and power.
Motors and generators.
Pattern shop machinery.
Pattern and box lumber.
Pig iron.
Planers.
Pneumatic tools.
Polishing and plating machinery.
Pulleys, metal and wood.
Punches, power and hand.
Pyrometers.
Radial drills.
Riveters, pneumatic.
Sandblast machinery and equipment.
Sandblast accessories.
Sand mixing machinery.
Saw sharpening machines.
Screw machines.
Separators, magnetic.
Shapers.
Slotters.
Sprue cutters.
Tool room grinders.
Track, industrial.
Tramrail systems.
Trolleys.
Trucks, hand and electric.
Turret machines, vertical.
Turntables.
Vertical turret lathes.
Vibrators.
Welding machines, oxy-acetylene.
Welding and cutting compounds.
Woodworking machinery.

The Reason Why

Besides the big exhibit of up-to-date labor-saving and output-increasing machines, the Annual Conventions of the Allied Foundry Associations will be held. There will be many discussions on the practice of the modern foundry or machine shop—discussions that will put you wise to things that will be the means of increasing the prosperity of **your** plant.

The Foundry and Machine Exhibition will benefit by your presence. But the benefit from experience received by our visitors will be still greater.

Come and let Chicago welcome you.

For Further Particulars Address C. E. HOYT, Secretary

Malleable Iron Castings

Plant operating under the supervision of men from our Chicago Works, men of long experience in this line.

OUR PRICES ARE RIGHT. ALL WORK GUARANTEED.
WE SHIP QUICKLY.

International Malleable Iron Co., Limited
Guelph, Canada

THE
Steel Company of Canada
LIMITED

PRODUCERS OF
PIG IRON
Foundry Basic Malleable

Bar Iron **Bar Steel**

Plain Bars and Twisted Squares for reinforcement of Concrete

Bolts and Nuts, Tacks, Screws, Wire Nails, Rivets, Wire

Immediate Shipment all Standard Sizes
Prompt Attention to Orders for Special Sizes

Wrought Pipe, Bale Ties, Lead, R. R. Track Equipment, Field Fencing

A Valuable New Book on an Important Trade

PATTERN-MAKING

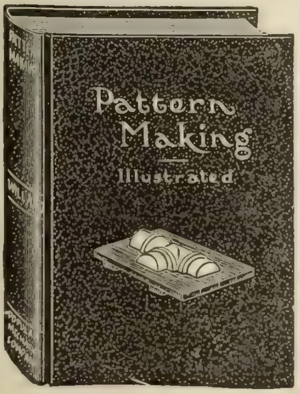
By G. H. WILLARD

Two Significant Opinions:

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

224 Pages. 312 Illustrations.
Cloth Cover.



With Additional Chapters on Core-Making and Molding

"WRITTEN SO YOU CAN UNDERSTAND IT."

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

Chapter Headings

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding Pattern Work.

Part II.—Core-Making and Molding.

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

NO. G.G. 3 STOCKS 14-26 & 40 INCHES LONG

The tools that give the longest service are the cheapest, not necessarily in the first cost, but they are in the long run.

Quality tools are an investment—they make money by saving money in every day of service.

Always look for the name Butterfield when on the market for Taps, Dies, etc., it is your positive protection against inferior quality.

Write for catalogue.

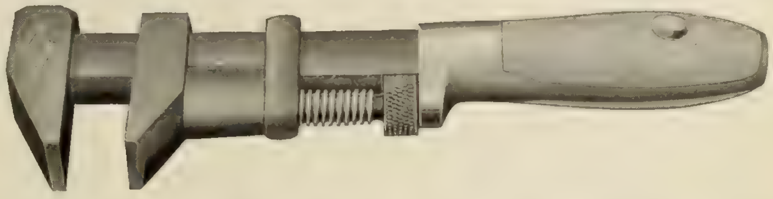
Starts That "Frozen" Nut

&
W B
CO

**The Marks
of
Good Tools**

W&B



When the nut that has rusted until it is frozen almost solid resists your efforts to start it with an ordinary wrench—just hit it a lick or two and try a

"W & B" Machinists' Knife Handle

on it.

Don't hesitate for fear it won't stand the strain. "W & B" Wrenches are the sturdiest, strongest wrenches that can be made by wrench experts.

Jobbers and Dealers Everywhere Will Furnish. If You are Delayed in Having Your Orders Filled, Write us and We Will See That You Are Supplied.

Ask for Machinists' Supply Catalogue No. 82-G Showing Complete Line of Screw and Drop Forged Wrenches.

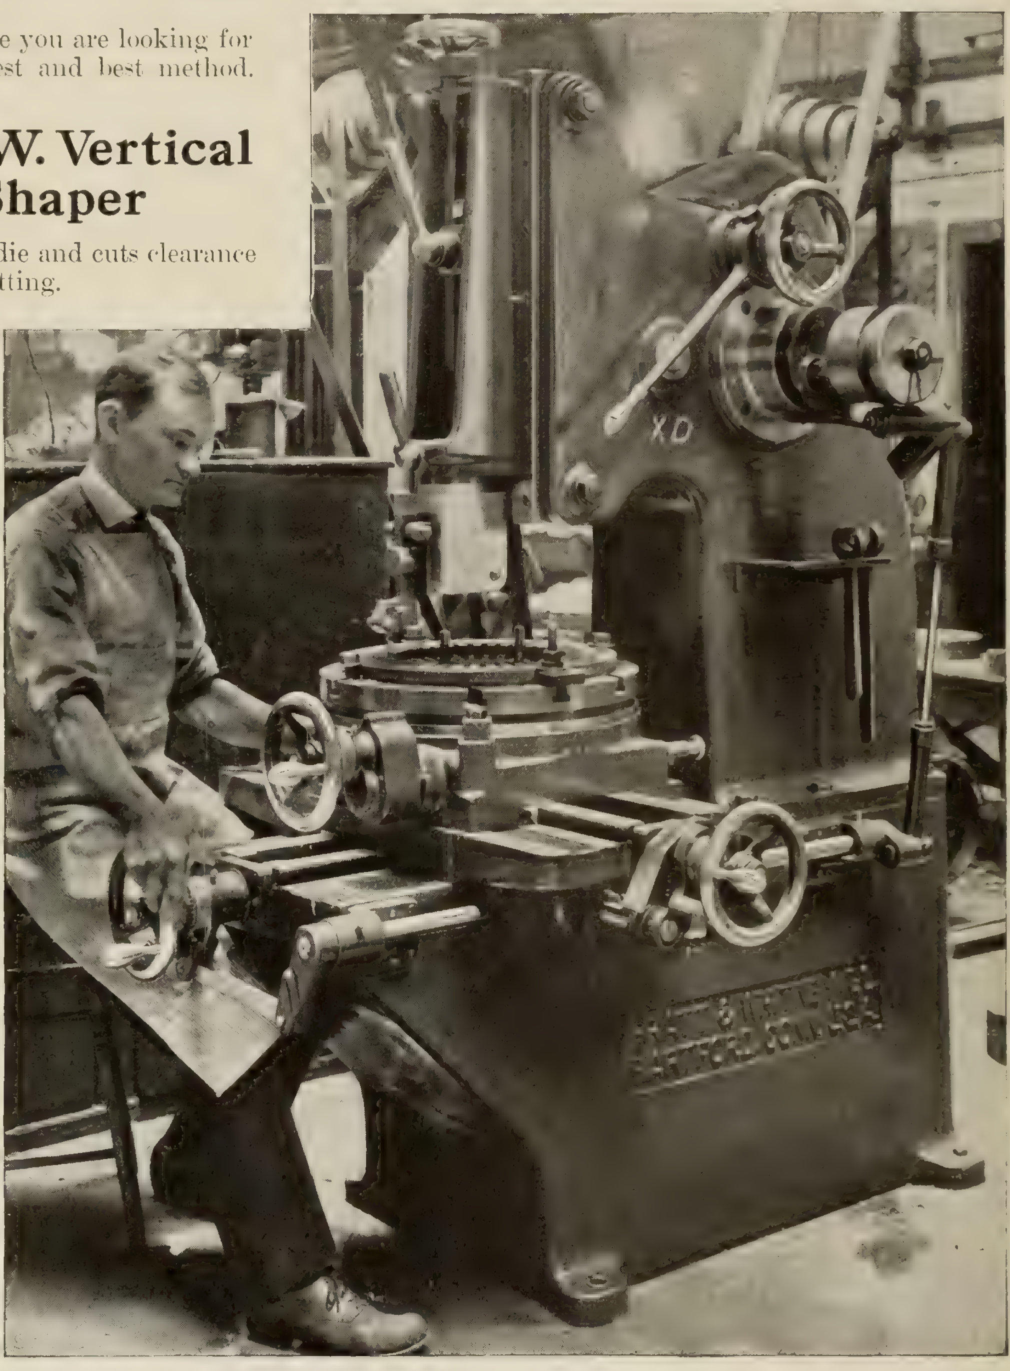
How Are You Machining Your Punching and Trimming Dies?

Of course you are looking for the cheapest and best method. Here it is.

P. & W. Vertical Shaper

machines die and cuts clearance at same setting.



Showing P. & W. Vertical Shaper at Work on Punching Die for Armature Laminations.

The I. & W. Vertical Shaper is especially adapted for finishing, punching and trimming dies. The cam bearing can be tilted, permitting the tool to cut at an angle from the vertical. Hence the desired clearance can be readily obtained.

Another advantage of the Vertical Shaper on die work is that when working to a line the cutting tool always enters the work where the line is scratched. Thus the line can be accurately followed. Convenient means are provided for indexing the table.

Write for illustrated circular and any further information desired.

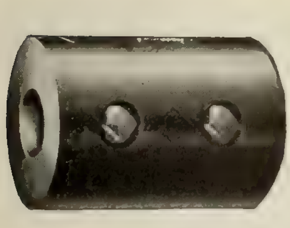
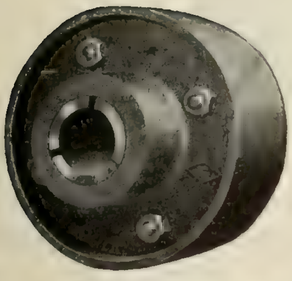
SHAFTING COUPLINGS



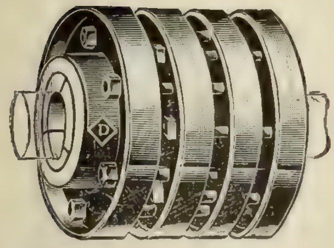
Solid Sleeve

DODGE SOLID SLEEVE

A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.



Single Compression



Double Compression

DODGE KEYLESS COMPRESSION

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.

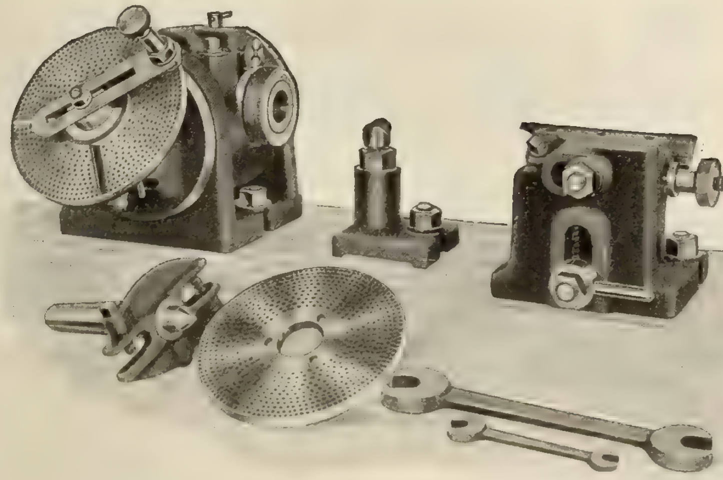
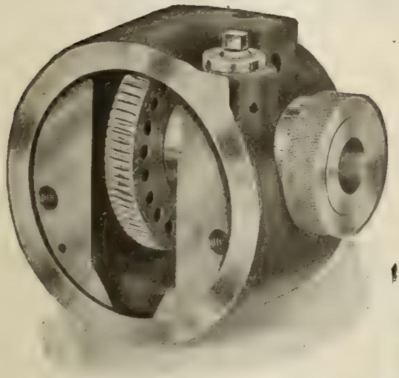
THE

KEMPSMITH UNIVERSAL DIVIDING HEAD





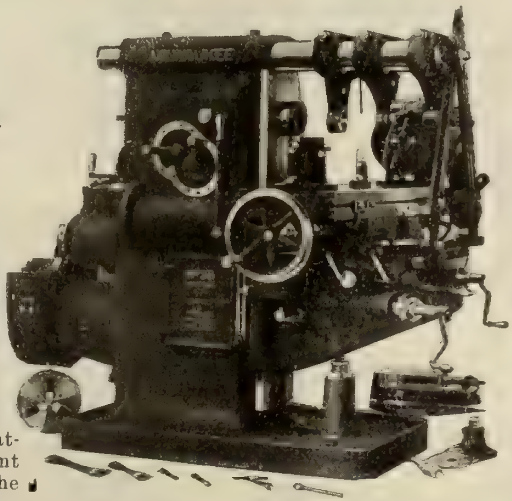
The WORM WHEEL is located centrally on the spindle, between the front and rear bearings, strictly within the head proper. Its position and very large relative size are here shown. It is $5\frac{1}{4}$ inches in diameter on the 10-inch size Head, and $6\frac{1}{2}$ inches on the 13-inch size. How do we get it? Write us for description of this wonderful new Head. Regularly furnished on all our Universal Milling Machines—also separately.

KEMPSMITH MFG. COMPANY, Milwaukee, Wis.

WHY MILWAUKEE MILLERS

Are Built Exactly As They Are

No. 9 Cutter Lubricating System



The large increase in the use of steel, either rolled, forged, or cast, in mechanical construction requires that effective provision be made for keeping the milling cutters cool.

An effective system of cutter lubrication such as is used on Milwaukee Millers, adds fully 40% to the productivity of the cutters, prolongs their term of usefulness, and lengthens the interval between sharpenings.

This system consists of a lubricating pump which lifts the lubricant from the reservoir in the base of the machine and keeps a liberal stream cascading over the cutter while in operation, removing chips and keeping it cool. This reservoir is entirely separate from the reservoir holding oil for lubricating the bearings, so that any lubricant may be used instead of oil for the cutters, if desired.

Thorough arrangements are made on the table to catch the lubricant used, returning it through screened pockets at the ends of the table and through telescopic tubing to the reservoir.

This system is provided on every machine, whether ordered or not, as practically every miller sooner or later finds its way on to steel or other material where effective cutter lubrication is necessary to flush away the chips and keep the cutter cool, thus maintaining the highest cutting efficiency and prolonging the life of the cutter.

These weekly "WHYS" give only one chapter each of a story of great interest to the prospective purchaser of milling machines. Our Bulletins tell the complete story. Write for copies.

Ground on their centers

All "Detroit" Drills are ground on their centers—*after hardening.* Each one is subjected to the micrometer test and no variation greater than the 1-2000 of an inch is permitted—except in the very largest sizes.

The cutting lips are equal—which means that both lips cut all the time without undue strain. Possibility of splitting, crushing or breaking is thus reduced to a minimum in

"Detroit" Twist Drills

The web is central. Many an expensively tooled piece has been spoiled because the drill holes were not exactly right. "Detroit" drills give accurate, polished holes.

Results guaranteed

Every "Detroit" Drill bears our trade mark, the high-efficiency sign, and each one is guaranteed against defects in design, material and workmanship.

Quick Work When A Belt Gives Way

When a belt breaks, the boy in charge of the No. 2

"Clipper" TRADE MARK Belt Lacer

runs to the spot with this compact 19-lb. machine, sinks the whole row of hooks (at one operation) into each belt end, stretches the belt over the lower pulley, inserts a Fibro pin through the inter-meshed hooks—
And the belt proceeds with the work. It is not necessary even to remove the belt from the upper pulley or shaft.

In 3 Minutes

**A boy has done a man's work—
Done it both Better and Quicker.**

It takes a skilled man 15 to 20 minutes to lace a belt with rawhide and get it back to work, plus the time required to get the rawhide and lacing tools. It takes a boy but 3 minutes with the Clipper—plus the time required to get the machine to the spot. And the Clipper Lacing is fully as durable as the rawhide, usually more so.
Clipper lacing is more flexible than the belt itself. The hooks are also sunk deep into the belt, flush on both sides. This way the full functional efficiency of the belt is maintained. In rawhide lacing, the bulging rawhide lifts the belt from the pulley, causing a loss of 80% of the contact surface at the lacing.

Our Free Trial Offer to Canadian Manufacturers

Our Canadian dealers are authorized to ship or deliver a No. 2 Clipper Belt Lacer and 3 boxes of Clipper Hooks to any responsible manufacturer for 30 days free trial. At the end of that period the manufacturer has the option of returning the machine and unused hooks—or paying for them. No charge is made for hooks used for trial purposes if machine is returned.

Net Retail Prices in Canada, Duty Paid.

No. 2 Clipper Machine	20.00
3 boxes of hooks—3 sizes	6.25

Each box contains 27 cards of 37 hooks each or enough to lace 84 inches of belt width both ends.

Elwell-Parker Electric Truck used at the Altoona Shops, Pennsylvania Lines.

The New Economical Way of Handling Material in Your Plant

Possibly it has not occurred to you that there is a more economical and efficient way of moving material about your plant than by means of the over-head carrying system?

Many industrial plants find the self-propelled, high capacity truck much more economical both in original cost and maintenance, and far more flexible than the old overhead trolley system.

ELWELL-PARKER ELECTRIC TRUCKS

Wherever used have shown an actual saving of from 25 to 65 per cent. both for railroads and industrial concerns. One large Canadian Plant trying electric trucks for the first time claims that each truck, operated by one man, has replaced eight men with eight wheelbarrows.

Elwell-Parker Electric Trucks are equipped with Edison Storage Batteries, which are recognized to be about the best on the market.

Elwell-Parker Trucks are extremely easy of operation, in no way requiring skilled labor, and by having a spare battery set can be worked overtime continuously without injury.

If you are extending or rebuilding your plant it will pay you to investigate this well-known truck.

What Men Fight About

When men really become men, they leave their personal feelings out of business affairs and approach all subjects for the purpose of settling them profitably and intelligently.

¶ The things that men quarrel and fight over are generally the same things that gorillas, monkeys, dogs and cats fight over—NOTHING. Practically all quarrels and unfriendliness existing between individuals are the result of misunderstanding.

¶ Most men carry their personal feelings into every transaction—and these personal feelings are spread out over such a vast range of territory that anyone venturing within shooting distance is regarded as a trespasser.

¶ The first sign of decay in business organization is misunderstanding, lack of co-operation, a vast influx of artistic temperament and a 'glutting of the market' of personal feelings.

¶ It seems strange to any one of us who stops long enough to think, that any man capable of leading an army, capable of conducting a business, capable of directing other men intelligently, is suffering with short-sightedness to such a degree that he allows jealousy or misunderstanding to cut off his vision, cut down his power and build up a wall around his opportunities for advancement.

¶ If the manager of any business machine listens with credulity or attends with care the gossip and hearsay which come to him in the cloak of business, he is listening to nothing more than the old 'back-fence gossip,' the 'mother-hubbard' stories, and the 'grandmother meddlings' of the ignorant and uneducated; tailored to adjust themselves to the conditions of the 'court,' so that they will be given a hearing.

¶ Also it may be well to add that the management of any business machine that permits itself to be influenced by prejudice, to be governed by stubbornness or to hold friendship above good policy, is surely speeding—with a wobbly outfit in which every screw is loosened—straight to the ditch.

¶ A great many men, and men of size in many respects, consider that a difference of opinion is a challenge to everlasting war and disagreement. The petty differences which exist between nations are similar to those which exist between individuals—but less excusable. Individuals are not expected to be sane and sensible more than 60 per cent. of the time—despite the fact that most of the troubles which exist between men grow out of a desire on the part of someone to attend to the business of someone else.

¶ If we discard our work, our business, our intelligence and our dignity, to engage in a wrangle or misunderstanding, we are no more highly developed, no more refined, no more dependable—at least for the time—than an ignorant ditch-digger, who lays down his shovel to engage a fellow ditch-digger in a fistic combat. And for that time—and for some time after—we are of no more value to ourselves, to our business or to the world, than the hyena who stands at the door of his den hissing and growling at the intruder who encroaches upon his domain.

¶ When nations are civilized their differences of opinion will be submitted to a tribunal whose authority will be final. When men really become civilized, when their minds and hearts are in actual harmony with the laws of the universe, the laws of life, the laws of beauty—then will they leave their personal feelings out of business affairs and approach all subjects for the purpose of settling them profitably and intelligently in the highest and best interests of the business of which such affairs are a part.

Efficiency

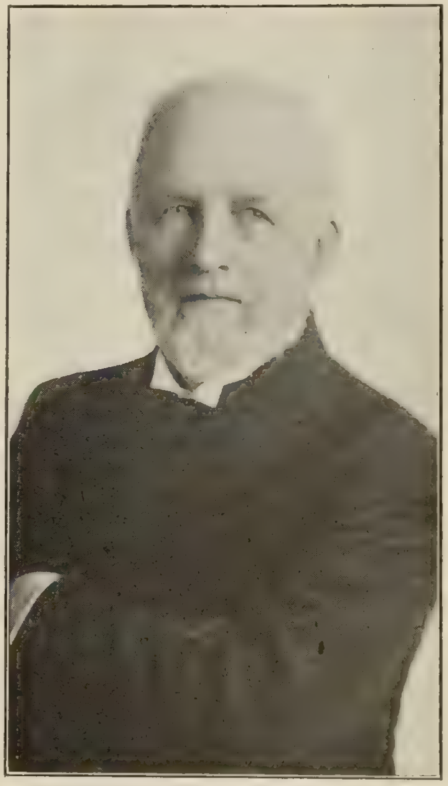
GEORGE BOOTH

THE name of Booth is associated with salvation, assassination, dramatization, and pulverization, but, George Booth, the Toronto Coppersmith who takes care of the C.M.A. gold, became a powerful factor in the industrial sphere of this Dominion through his throwing the energy which marked a successful business career into the organization known as the Canadian Manufacturers' Association. Like his famous namesake, J. R. Booth, the lumber king of Canada, and William, the late lamented general and founder of the Salvation Army, he affects a white beard, which gives him away, for without it, no one would believe he was seventy-five years of age. The name sounds English enough, and Irish enough, but he is an Englishman, having been born in the town of Cranbrook, county of Kent, in the year 1838. Since that day, he has wandered to and fro, first to London town at the age of six, then to Pittsburg, Pa., to Toronto, and back again into the United States, where he received his education in the schools of Buffalo, N.Y.



GEORGE BOOTH.
Treasurer Canadian Manufacturers' Association.

Eventually, with his father, he returned to Toronto, and helped to found the business of Booth & Sons, with offices at 181 Yonge Street, which became the Booth Copper Co., Ltd., in 1910, and now bears the name of the Booth-Coulter Copper & Brass Co., Ltd., since its amalgamation with the firm of William Coulter & Sons. Of this firm he is president.

George Booth has a reputation for attention to business. He takes things easily these days; nevertheless, at the age of seventy-five he still puts in nine hours a day at the office, that is, when his time is not taken up with outside work. He is a director of the Canadian National Exhibition, and it rests considerably with him whether a new machinery Hall is built or not.

During the height of the Exhibition this year, when other men were rushing around attending to petty details, Mr. Booth was seen standing on the steps of the Administration Building, calmly smoking a cigar. "Don't you feel the worries of a big organization pressing heavily on you?" someone asked. He just smiled, and shook his head.

Some men have achieved success by hustle. George Booth looks at things calmly, benignly, sensibly, and acts after much deliberation. He would look ludicrous running. No one need fear approach him. Even to reporters he is kindly and courteous, which is saying a lot in these days.

This, then, is the man who is known as the watchdog of the C.M.A. Treasury. He did not go to Halifax, and nobody wanted to know why. Every manufacturer in the C.M.A. is content to leave the gold in his hands as long as ever he desires to hold it. He should know something of the aims and objects of the C.M.A., and the C.M.A. should know him, for he is three times a life member of the Association.

Just a word more about his business. There are so many opportunities and temptations in a new country like this, tending to draw men away from an old trade, that it is a credit to George Booth that he has stuck to the craft of his ancestors. His grandfather was a coppersmith in the declining years of the eighteenth century. Early in the ninteenth, Henry G. Booth, father of the subject of this sketch, came on the scene, and later established a coppersmith business in Toronto. The twentieth century sees the grandson and the great-grandson still coppersmiths, though on a grander scale than that carried on in the old Kent village. Surely a splendid record.

The Design or Re-Design of a Factory Lighting System*

By M. H. Flexner and H. O. Dicker

Better light is as necessary as sanitary requirements and with these it should rank among the first. The aim of this paper is to bring out a few of the most important factors, relative to this all important feature, and to show how easily and cheaply existing unsatisfactory conditions may be bettered.

IT is somewhat discouraging to the illuminating engineer to read article after article dealing with the methods used to raise the sanitary condition of the factory, and when all have been read, he asks himself, "What about the lighting?" Ventilation, cleanliness, devices for safe operation of machines, rest rooms for employees, are all discussed, but little or no attention is given the lighting. It is the hope of the authors that this paper will emphasize the fact that factory lighting is a subject dealing directly with sanitation, and that it should be considered as such.

Importance of Good Lighting.

Why is the lighting important, and whom does it affect? Does it mean a benefit for the central station only, or is it of equal benefit and importance to employer and employee? It seems just as reasonable to ask why should a factory be ventilated, or why should it ever be cleaned up. The owner or manager would immediately say: "If I do not ventilate the work rooms, the operators will become dull and lose interest in their work." Regarding his lighting conditions he knows naught, and his answer to a question relative to his lighting condition would very likely show that he never gave it much thought. This is just the man who needs some information regarding lighting. He does not realize that just as many of the headaches are caused by poor lighting in factories as there are from poor ventilation.

This is not intended to belittle the importance of good ventilation, but is only mentioned to emphasize the fact that general improvement of condition does not end when a factory has been properly ventilated or properly cleaned. It does not end until the lighting as well as these have been considered. One is just as important as the other, since injury to the eye from poor lighting causes suffering equal to or even greater than the sickness caused from poor ventilation. In considering such vital subjects, we seem to be far in the rear of countries on the other side. We're behind the times, so to speak, and have not kept pace with France, England and other European countries, who are protecting their workmen, along these lines.

What is Good Illumination?

The first question that might be asked is: What is good illumination, or what is practical "lumination? Can we spot a unit or cluster here or there, put a drop light over the working places in a slip-shod sort of manner and expect to be satisfied with the results; or, is it a matter of knowing what to expect from each means of illumination and its corresponding reflector, and to fit in these units to meet the conditions in the factory? Our common sense dictates that it is the latter. Our experience teaches us that the problems involved are often difficult of solution, and that we must have definite ideas about correct illumination before we attempt to accomplish satisfactory results.

One authority defines good lighting as any system which does not attract attention to the means of illumination, or cause one to wonder how the illumination was obtained. An analysis of this yields the following requirements for good lighting:

First, that sources of high intensity must not be in the field of ordinary vision; second, that the amount of light be sufficient for the work to be done; third, that the distribution of light be uniform or as nearly so as possible; and fourth, that the color be pleasing to the eye. By adhering to these principles, we will not go far wrong in laying out lighting installations, whether for factory or for home, being assured of good illumination.

Value of Good Illumination.

The value of good illumination should not be under-estimated. Some are contented to travel along in the old-time worn ruts, and to leave well enough alone. Many believe that as long as there is light, whether good or bad, the question of lighting is settled, and that the results obtained are as good as any light could produce. This is the wrong idea, but nevertheless it is entertained by many managers and officials of factories under whose jurisdiction the question of lighting comes. They must, however, realize sooner or later the value of better operating conditions, produced by good lighting. To do work, light is necessary; with a light, a little work can be done, and, with more light, more work can be acomplished. This is very evident, and it is easily seen that no matter how a shop is lighted, if it can be better lighted, better or more work must result, up to a definite per cent. increase in efficiency of the workman.

What if our Mr. Official had to go home to a dimly lighted dining room? How would he like to read a paper which necessitated straining his eyes, or shave in little or no light, with his face very near the mirror and his eyes fixed in a staring position? It would not be very comfortable, and he could hardly give himself much of a shave; yet under these conditions he expects his men to work, to turn out good work, and make his factory an efficient one.

Initial Cost the Barrier.

There are such things as good and bad lighting installations, and to the progressive official the best should not be too good for his men. However, the initial cost is given first consideration, and is the one stone that lies in the path of all changes, and, therefore, we can but sum up the reasons why it is worth every cent that is asked in making a lighting installation a good and efficient one.

Statistics have shown that, as the result of better illumination and a decreased strain on the eye, the physical condition of the workmen is better, they are better satisfied, imperfections in the work have been materially decreased, and the factory output increased from 8 to 15 per cent.

Accident Risk Feature.

Not only is the general physical condition of the workman improved by better lighting, but his liability to accident is greatly decreased. Recently published statistics show that during those months of the year in which artificial lighting must be used, there occurs a greater number of accidents than in the light months. The saving made by good lighting in this line alone will often more than repay the extra cost of installing and maintaining the lighting system. It has been said that a man who is obliged to keep one eye on the danger points of a machine has only one eye left to operate it. This is unquestionably true, and consequently a machine must be made absolutely safe. The factory manager usually tries to accomplish this by putting a guard rail around the danger points or else enclosing them entirely. This seems about as reasonable as putting a rail around a hole in a street without placing a lantern on it.

---

*From a paper read at the Seventh Annual Convention of the Illuminating Engineering Society, Pittsburg, Pa., September, 1913.

Protected machines still cause accidents, and will continue to do so until the proper light is provided and the danger points brought well into view. Accidents are becoming more expensive each year, and, disregarding all humanitarian arguments, an owner can no longer neglect to protect the operators from accidents. Good light is the most effective protection that can be provided, and only carelessness on the part of the employee will incur accident under these conditions.

"It costs us a lot of money, but it has paid for itself in less than a year," said one manufacturer. What more can an owner want? Certain courts have held that failure to illuminate danger points constitutes "contributory negligence." Germany, Austria, Holland and France, realizing the importance of good lighting conditions, have included lighting in their codes for factory inspection of health and safety.

In the installation one must take into account the position of the machines, the work that is done, the location of posts, the windows, and, in fact, every condition which may in some way cause deep shadows and bad illumination. The scope of this paper does not allow us to enter into any detailed account of layouts. As stated in the introduction, we are only attempting to emphasize the necessity and advantage of better factory lighting.

Good Lighting Available.

Good factory lighting is not beyond reach; it is not something that one can only wish for. It is a material thing and may be had for the asking. A great many bad installations can be made good ones by two inexpensive methods; either re-locating the units and the addition of proper reflectors, or in some cases by replacing existing units with some of the modern efficient type now on the market. It is not hard to show that the new system will, within a given time, pay for itself, and in a great many cases save money over the operating and maintenance expenses of the old system.

Assume that the owner of a factory depends solely upon the profits of the work his employees turn out. An equation expressing output must involve the personal equation of the men, and there must be a certain personal efficiency of each man under every condition in which he works. If a high-priced man is placed under poor working conditions, his work will be no better than the low-priced man under good conditions. A manufacturer will usually buy a labor-saving device or a machine with which his workers can turn out more or better work, and he will supply his employees with tools of the highest grade steel, and have men to keep these tools in the very best condition; but he often absolutely ignores the personal efficiency of the operator and the conditions under which he must work. He does not usually see all the methods of making the man as perfect as his tools. In other words, more time and thought is given to the tools than the operator.

What good is a perfect tool or machine if the operator can hardly see what he is doing with it? This sounds ridiculous, of course, but it is true of many factories to-day. For instance, a manufacturer purchased a certain machine at a cost of $18,000.00, and paid a high priced man of long experience to operate it. Yet this owner could not see his way clear to spend $19.00 in order that this high priced operator would not have to take the product twenty feet away to the window to caliper it. This shows how little the owner considered the personal efficiency of his men.

Illumination Cost.

The cost of illumination as compared with an operator's salary is very small and insignificant; in fact, so small that the manufacturer can not see it at all. The following data, taken as average conditions, show this.

If a 100-watt lamp is assumed for each man, and that it burns 3½ hours per day for 300 days, the following is derived:

Cost of lamp (Commonwealth Edison Co. renewal)		$0.00
Cost of reflector		1.00
Cost or wiring per outlet		4.00
Total first cost		$5.00
Interest on investment 6%	$0.30	
Depreciation at 12½%	0.70	$1.00
Power at 5c		5.00
Cleaning at 3c. per mo		0.36
Renewal of lamps		0.00
Total		$6.36

Wages for 10 hours a day, 300 days, may be assumed to be $1,000.00. Thus the ratio of the cost of furnishing illumination to a man under the above conditions would be (overhead expense not included), $\frac{6.36}{1,000}$, or 0.636 per cent.

The following mathematical deduction shows what good lighting would mean to a factory upon the installation of such a system. Taking an area of 30,000 square feet with an average of 0.75 watt per square foot, a connected load of 22,500 watts would result. Figuring the installation with 250 watt units, an estimate of the first cost is surprisingly low:

90 250-watt outlets at $3.50	$315.00
90 fixtures at $1.25	112.50
90 reflectors at $1.00	90.00
90 lamps (Commonwealth Edison Co. renewal)	0.00
Total	$517.50

Let it be supposed that this factory turns out a yearly business of $250,000, and that 33 1-3 per cent., or $83,333.33 of this business is done under artificial light. Assuming a conservatively 5 per cent. increase in output as the benefit due to good lighting, the business is then increased $4,166.67. If there is a profit of 20 per cent. on this output, a credit of $833.33 is derived, which is considerably more than the installation cost.

Data From Trial Installations.

As further proof of the low installing and operating costs of good lighting the following data are submitted from a table compiled from actual figures on three trial installations in a large factory with lamp prices, etc., revised so as to be up-to-date.

100-Watt Tungsten Lamp.

30 reflectors at 92 c	$27.60
Wiring at $3.22 per outlet	96.60
30 lamps at 0.72	21.60
Total	$145.80
Interest on investment at 6%	$8.75
Depreciation on reflectors at 12½%	3.45
Depreciation on wiring, etc., at 5%	4.83
Renewals at 30 × 900-1,000 hrs. × 0.621	16.77
Energy 3,000 × 900 hrs. × 1.1 c.	29.70
Labor (cleaning 30 × 0.63 × 20 c.)	3.78
Total annual cost	$67.28

These figures are derived on the assumption that good factory lighting will necessitate a 100-watt lamp for 100 square feet of working area required by an ordinary workman. With these assumptions, the following information has been tabulated:

Total working hours 300 × 10	3,000 hours
Total lighting hours 300 × 3 1-3	1,000 hours
Average cost of labor per hour	35 cents
Labor—	
3,000 hours at 35 c	$1,050.00
Light—	
Cost of 100-watt tungsten lamp (Commonwealth Edison Co. renewal)	$0.00
Cost of metal reflector (trade price)	1.00
Average cost of wiring per outlet	3.50
Initial investment per outlet	$4.50

Interest at 6% on $4.50....	0.27	
Depreciation at 12½% on $.50	0.56	0.83
Cleaning 12 mo. at 3 c......	0.36	
Lamp Renewals (Maintenance	0.00	0.36
Energy 100 K.W.H.at 5 c.......		5.00
Annual operation cost		6.19
Annual wages for one man....		$1,050.00
Cost of light in per cent. of wages		.59

When reduced to cost per hour based on 3,000 working hours per year, one finds:

Labor per hour	$0.35
Light per hour	0.00619
Cost of light per day........	0.02063
Cost of labor per day	3.50

These figures go to show that the cost of good lighting is a very small portion of the cost for a man's time; in fact, if good lighting would save five minutes of a man's time per day a material gain would be experienced. By following this form, any local conditions causing different prices than those given can be substituted so that a comparative figure can be obtained for any particular locality.

Tungsten Lamps Maintenance Costs.

The cost of maintenance of tungsten lamps and reflectors is stated as follows in the 1911 Proceedings of the National Electric Light Association.

	Per Cent.
Renewals of lamps	75
Renewals of broken reflectors....	3
Labor making renewals......	0
Changing reflectors for washing	16
Labor for washing reflectors	2
Additional indirect charges...	4
	100

This data is from experience with an installation of between 7,000 and 8,000 lamps and reflectors.

Individual Conditions Feature.

With the available units, it is impossible to pick out one lighting unit, and say that it can be used for all conditions. There is no one cure for all evils. Individual conditions enter into the problem, and the resulting unit must be best for the conditions presented. The most important qualifications are the following: Efficiency; color; quality; arrangement of machines — processes; adaptability; special architectural features; and available hanging height.

The best unit to use will be the one that best fulfils these requirements. Each light source, whether gas arc, individual gas, electric incandescent, arc or vapor lamps, has its definite field in factory lighting. Usually where one should be used, the others will be less satisfactory. It is hard to convince the owner that the cheapest is not the best, for he usually wants light only, and often will not pay for the necessary equipment to produce illumination. The problem of which one to use depends upon the class of work to be done under it, as each lamp has certain characteristics that argue for and against its use.

Arc Lamps.

The last few years have brought great developments in the arc lamp. The flame arc of long life furnishes a light source of high candle-power and low maintenance cost. When the white light-giving carbons are used, the light emitted is of good but rather variable color. This lamp should never be used in the normal range of vision. It is best adapted to factories with high ceilings, as the intrinsic brilliancy of this light source is 5,000 candle-power per square inch. There has been considerable talk about the harmful ultra-violet rays emitted from arc lamps. These rays are no doubt given off to a considerable extent, but they are lost in the inner globe. Therefore, this characteristic should not be an argument against the arc lamp. The greatest objection to this light source is its unsteadiness, and for fine accurate work a more steady unit might better be used.

Mercury Vapor Lamps.

Mercury-vapor lamps are particularly well adapted to certain kinds of manufacturing. The peculiar color, together with the high visual acuity, renders them very useful. A large clothing manufacturing concern has recently replaced enclosed arcs with vapor lamps in pressing rooms. It is remarkable how scorching can be detected under this lamp, while if a tungsten lamp be used, the scorch is not so noticeable. The vapor lamp has met with decided approval in this kind of work, which goes to show that the unit adopted should depend entirely upon the work to be done.

Tungsten Lamps.

In installations where the tungsten lamp is the source of light, too much emphasis cannot be put on the subject of cleaning. The manufacturer would not allow his operators to leave their machines at night without cleaning them; the floors are cleaned and each morning the factory is found in tip-top shape. Why? So that the work may begin under the best conditions. The owner knows that time and money spent in cleaning a machine is well spent, and yet that which has a greater effect on the efficiency of the operator is left to accumulate dirt from day to day and in many factories from month to month.

Light Location..

In general, it is best to have the light source as high as possible above the working plane. If it is out of reach of the worker, he cannot handle it, and thus it will be free of a coating of oil or other dirt. Truly enough, certain machines require drop cords in setting up the work or changing the dies, but few machines actually need drop cords during their operation. One big railroad shop in Chicago has adopted Cooper-Hewitt lamps for general lighting, and drop cords are checked as any other tool. In this way they are taken care of, and are not used except when necessary. It has been our experience that the worker will use a drop cord as long as he has one in front of him. The first move for efficient lighting is general illumination, where possible, doing away with the drop cord, or as above stated, making the drop cord a working tool.

Concluding Observations.

In summing up, we believe that the campaign for good factory lighting has just begun, and that the best argument in favor of better illumination is a statement showing the benefits derived from an efficient lighting system and the experiences of others. Even a hasty reconsideration of the arguments presented in this paper demonstrates the tremendous scope and possibilities along this line. There is no longer any excuse for poor lighting, for the necessity, the practicability, and the economy of good illumination have been demonstrated beyond question, and if the strides in this direction which have been made in recent past may be taken as an index of those which will be made in the future, there is no doubt that very soon the time-worn phrase, "a badly lighted shop," will have disappeared from the vocabulary of those connected with the lighting industry.

We believe that if a fair and broad-minded manufacturer will but figure out in a common sense way the merits and necessity of good illumination, he will be converted to its use in a short time. If his own figures do not satisfy him, let him consult those who have been far-sighted enough to go ahead, and he will realize sooner or later the needs of his men—better atmosphere, lighter and cleaner shops, and proper illumination.

* * *

Manufacturers Will Wear Identity Button.—After organizing, the Vancouver Manufacturers' Association found that it was rather difficult to become acquainted with one another, and to facilitate friendship a numbered lapel button is now proposed. The wearer possesses a numbered badge and a card with numbers and names opposite. When he sees a man with a numbered button he notes the number and looks up the card. Opposite the number is the man's name, and the other man doing the same, they address one another by their right names.

New Grey Iron Foundry, Etc., Montreal Locomotive Works

Staff Article

Although the foundry here described is not yet quite completed, it is sufficiently far advanced to enable an adequate conception of its general features and lay-out to be formed. It shows evidences of carefully thought-out design, and will prove an important factor in increasing the output of this Canadian locomotive works.

DURING the past few years, the demands of the railroads for rolling stock of every kind have increased enormously, and locomotive and car builders have consequently been kept extremely busy. As a result, new plants have sprung up in various parts of the country, and old plants have been added to or in some cases almost entirely remodelled.

In common with other firms, the American Locomotive Company, who are probably the largest builders of locomotives in the world, have had to add to their several plants from time to time in order to keep abreast of their orders, and they are now completing extensive additions to their Canadian branch,—the Montreal Locomotive Works. These additions comprise a new machine shop, grey iron foundry, and a running shed. Of these, the foundry is the most important, the other two being in the nature of extensions to existing shops.

The new running shed forms an annex to the erecting shop, which is of the transverse type. It stands about halfway down the erecting shop, and is intended to relieve the latter of much of the lighter work. As soon as the heavy erecting is finished, and an engine wheeled, it will be taken out into the running shed where the lighter work will be completed under a 10-ton crane, thus giving increased space in the erecting shop and enabling the 120-ton crane to be more or less continuously employed on lifts better suited to its capacity.

The new shed is 122 feet long by 66 feet wide, and has three locomotive pits, pitched at 18 feet centres, running its full length. A 10-ton Northern crane of the 3-motor type serves the whole floor area. The walls of this building are of 8-inch reinforced concrete for a height of 4 feet from floor level, above which they are of 2-inch reinforced cement plaster. The object of this form of construction is to facilitate the extension of the running shed sideways at some future time. The height of the roof is 40 feet above floor level, while the head room to the roof truss chords is 33 feet. Good natural lighting is secured by continuous swinging sash windows at each side. These extend about 16 feet down from the roof and are operated by levers from floor level. The entrances to the shed are fitted with rolling steel doors operated from inside or outside the building. Artificial lighting is by tungsten lights, and heating is by direct radiation The smoke jacks below which the locomotives are steamed are connected with an underground duct, through which the smoke is removed by an exhaust fan.

New Machine Shop.

The new machine shop is situated at the north end of the new foundry and adjoins the old machine shop. It is 222 feet long by 132 feet wide and is divided by central steel columns into two 66 ft. bays. Each bay is extremely well lighted by long skylights in the roof. These skylights are built with lead-covered steel bars, and are provided with copper

NEW FOUNDRY STORAGE BAY AND CHARGING FLOOR.
The open space below charging floor forms the blower room.

ventilators. The general construction is of steel and brick, with a concrete water table 5 feet high. The steel window frames are fitted with Fenestra sash, and the monitors with swinging sash in three sections, opening the full length of the building. There is a flat gypsum roof covered with tar paper and gravel. It is of fireproof construction, and is similar in every way to the roof of the foundry.

At present the north bay of this building is being used for heavy machine work,—principally cylinders, while the south bay is being temporarily utilized as an assembling shop for tender trucks and a paint shop for tanks and cabs.

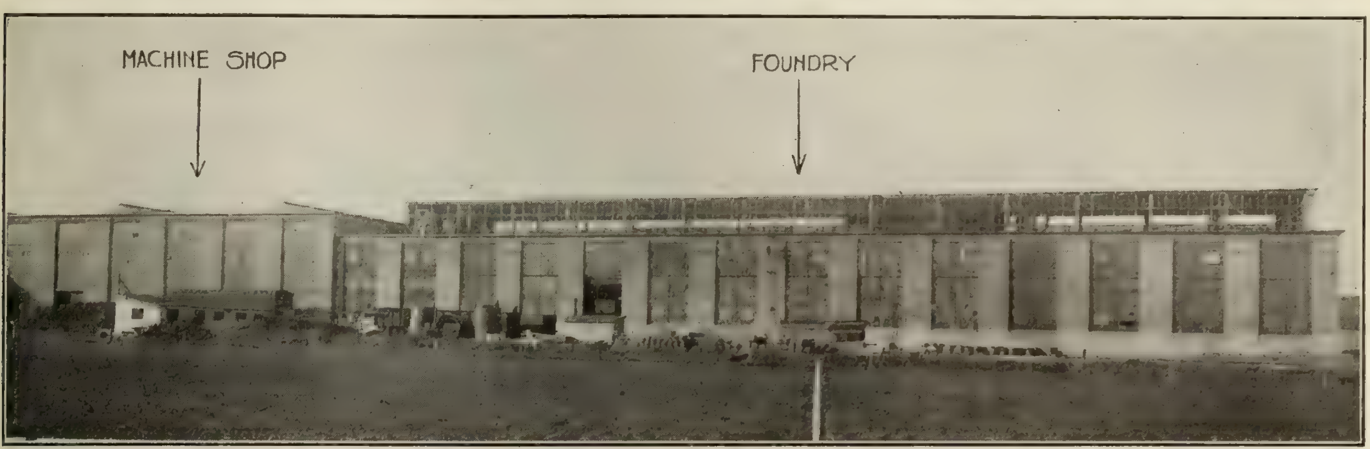
The majority of the machine tools in the north bay are arranged for group driving, but the larger ones have individual motor drives, the heavy planers being fitted with the Niles reversing motor drive which is giving excellent satisfaction. This machine bay is served by a Niles 3-motor crane of 10 tons capacity, while the other bay has a 16-ton crane of similar type and make.

The shop is lighted by tungsten lamps and heated on the indirect expansion system, the hot air being conveyed in underground ducts to openings at floor level.

The Grey Iron Foundry.

The new foundry forms the largest, and perhaps the most important, part of the plant extensions. It adjoins the new machine shop and, like the latter, is a self-supporting steel structure of fireproof construction. It is 280 feet long by 222 feet wide, divided into four bays. The general style of construction is similar to that in the machine shop, the walls being of concrete and brick. The concrete extends 5 feet above floor level, and, from this height nearly up to the roof, there are large steel sash windows as may be seen in the illustrations. These, combined with the windows in the sides of the monitor over the main bay, give splendid natural lighting. In fact, this foundry will very probably prove to be one of the best lighted in the Dominion.

A special feature of the foundry is a large storage bay extending the full length of the building. This bay is 280 ft. long by 66 feet wide and affords space for the storage of a very large supply of pig, coke, sand, etc., and entirely eliminates the necessity of going out into the usual foundry yard for supplies of raw material. In severe winter weather, it is extremely hard to get men to do this class of work where no protection from the elements is afforded them. This storage bay has a standard gauge track running up one side, by which material is brought in. The track continues on into the machine shop, and, is, of course, connected with the yard trackage system at both ends. It is only



NEW FOUNDRY AND MACHINE SHOP, LOOKING EAST.

STORAGE BAY
MAIN BAY

SOUTH END AND EAST SIDE OF NEW FOUNDRY, SHOWING ENTRANCE TO STORAGE BAY.

in a few of the most modern foundries that this idea of an enclosed storage bay is to be found, but it is a feature that will doubtless be more often adopted in future in northern latitudes, as, in those few foundries already so designed, the additional cost has been found to be fully justified.

Leaving the storage bay for the present, attention may be directed to the main part of the foundry. This consists of a main bay 66 feet wide and two side bays of 45 feet. The main bay has a height to roof of 46 feet and to the lower side of roof trusses of 37 feet. It is served by one 10-ton and one 20-ton Niles crane, and will, of course, be chiefly used for cylinder moulding and other heavy work; though part of this floor will probably be occupied by bench moulders also.

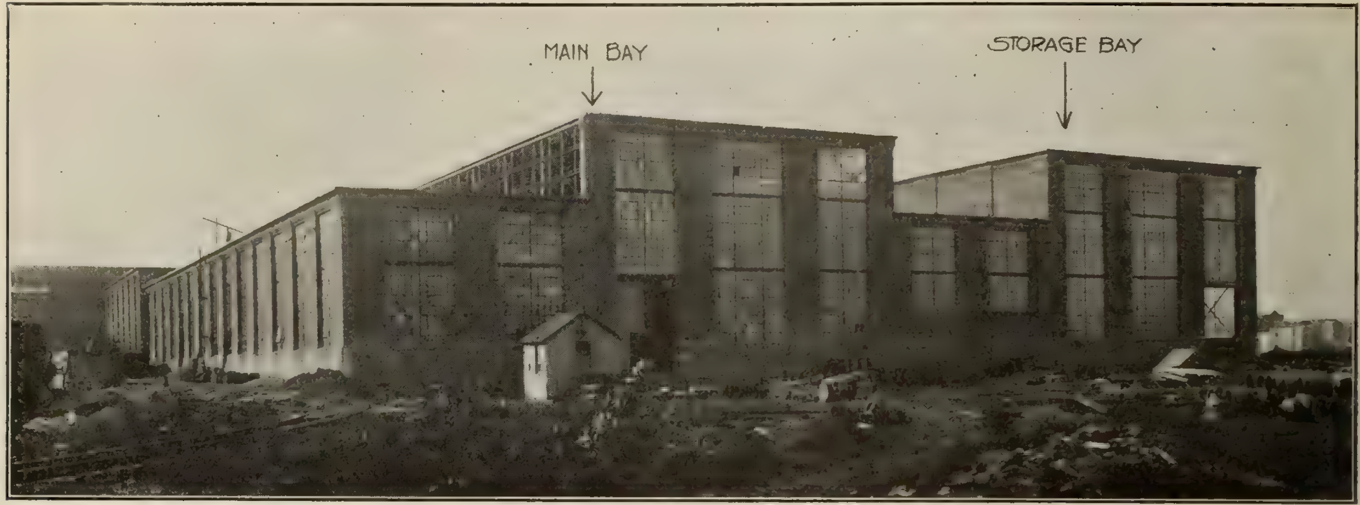
The Side Bays.

The side bays are 45 feet wide, with a height to roof of 31 feet, and to the under side of trusses of 24 feet. The west bay will be devoted to core-making and light moulding operations and is served by a 5-ton Northern crane. At one end of this bay is located a small store room, above which is the lavatory room. The latter is reached by an easy stairway and is fitted out with conveniences of the most modern type. In addition to those found in this room, porcelain urinals are built into the walls at convenient points around the foundry. Sanitary drinking fountains are also provided, and the general comfort of the men is well looked after. The foundry will be heated in winter by the indirect system, the hot air being carried in overhead galvanized sheet steel ducts. From these it will be brought down to a suitable height above floor level by bifurcated down pipes.

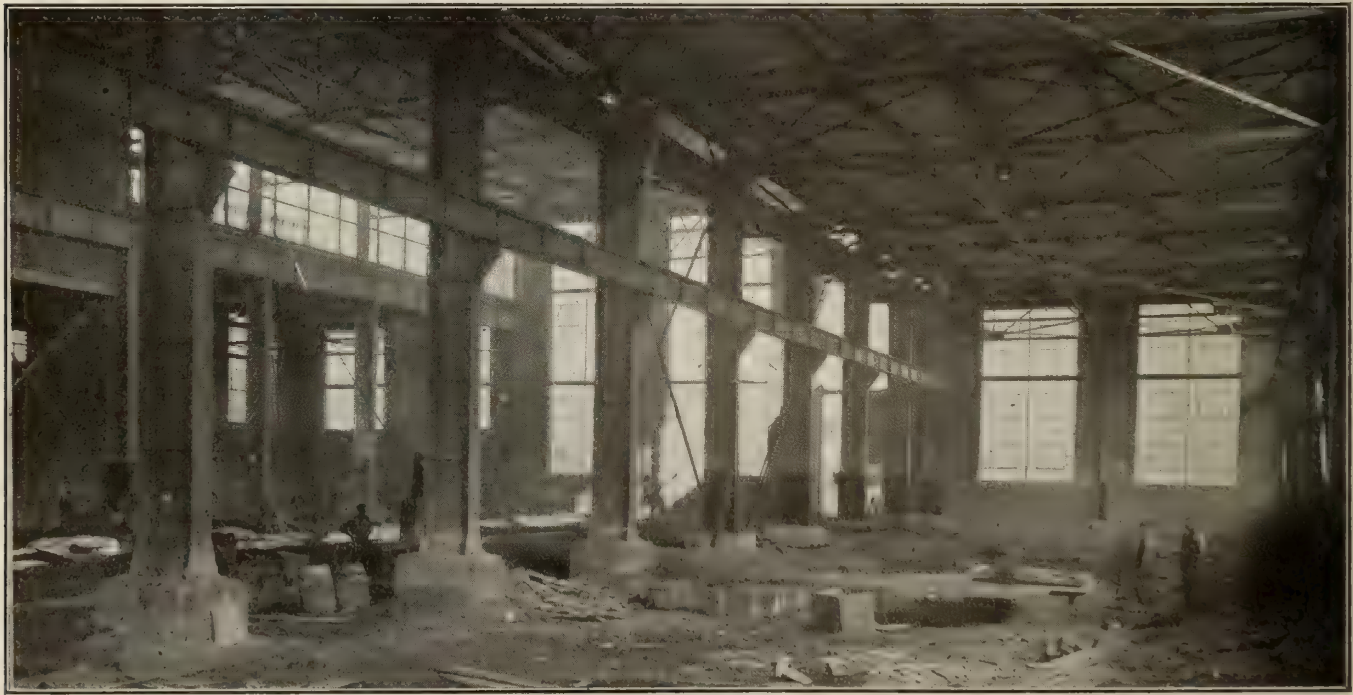
Cupolas, Cleaning Room, Etc.

The east 45 ft. bay is occupied by the core and sand mixing departments, the cupola room, a small carpenters' shop and the cleaning room. The cupola room contains two cupolas, a No. 8 and a No. 9 Whiting. Below the charging platform the cupola room is divided into two parts by a longitudinal brick wall, the rear portion forming the blower room. The blower will be electrically driven, but the type has not yet been definitely decided upon.

The charging platform is the same length as the cupola room,—60 feet, but is considerably wider, so that it projects out into the storage bay, as may be



SOUTHERN ELEVATION OF NEW FOUNDRY.



THE FOUNDRY, LOOKING SOUTH, SHOWING GENERAL STYLE OF CONSTRUCTION.

seen in the illustration of the latter. The object of this is to enable the 10-ton crane in the storage bay to deliver the skips containing the charges direct to the platform. The charges will be weighed en route on a multiple beam portable weighing machine suspended from the crane hook.

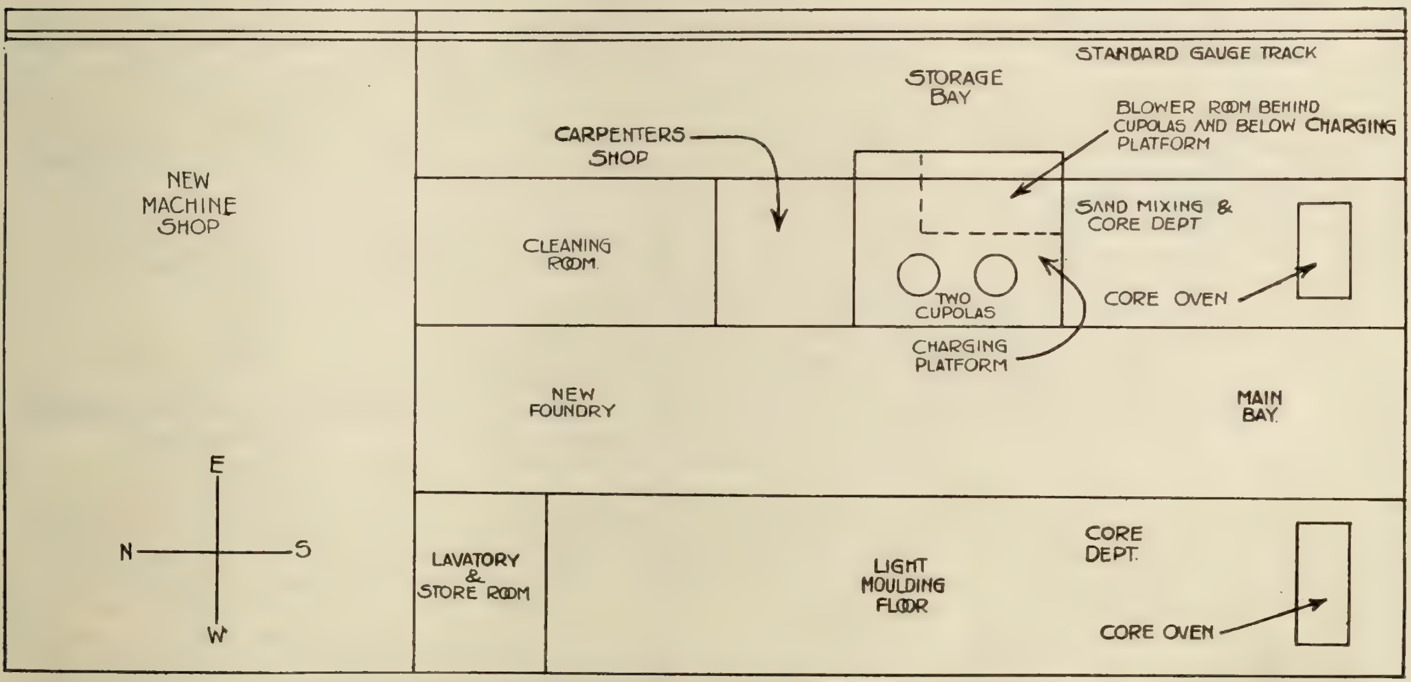
Instead of the charging having a number of narrow gauge storage tracks served by a transfer table, as is often done, it is equipped with a 5-ton overhead crane. This will pick up a skip from any part of the platform and transfer it to a narrow gauge track. It will then be run on to the pneumatic charging machine with which each cupola is fitted. Provision has been made for extending the charging platform in a southerly direction and installing a third cupola at some future date, if found necessary.

At the north end of the cupola room there is a small carpenter's shop entirely enclosed with brick walls as a precaution against fire. It is 20 feet long by the full width of the bay, and will be used for making and repairing wooden flasks. Next to the carpenter's shop is the cleaning room, 120 feet by 45 feet. A 10-ton Northern crane serves the whole length of the room. Sand blast apparatus and other up-to-date equipment will be installed, the cleaning room being of course piped for compressed air, like the rest of the foundry.

The building is entirely fire-proof, there being no wood work whatever in the interior; except a few small doors, and these are covered with sheet iron. The main doors are of the steel roller type.

This foundry has been built to the designs of Mr. William Dalton, chief engineer of the American Locomotive Co. The foundations and concrete work were built by the American Locomotive Co., while E. G. M. Cape, Montreal, was the contractor for the brick work. The structural Steel Co., Montreal, fabricated the steel work, and the contractors for the gypsum roofs were the Keystone Fireproof Roofing Co., New York., and for the tar and gravel roofs, Jas. Akroyd & Sons, Albany, N.Y. The foundations were completed in time to allow the first steel work to be erected on June 1st of this year. The building is now more than 90 per cent. completed, which will generally be conceded to be a very good performance.

The Montreal Locomotive Works fully expect that these additions to their plant, which have cost in the neighborhood of $600,000, will enable them to increase their output by more than 30 per cent. For the year ending June 30, last, they turned out 300 heavy locomotives, and are aiming to increase this figure to 400 in the next twelve months. The new machine shop is already in operation, and is giving considerable relief to the older shop.



GROUND PLAN AND NEW FOUNDRY LAYOUT, MONTREAL LOCOMOTIVE CO.

LAKE SUPERIOR CORPORATION.

THE annual meeting of the Lake Superior Corporation was held at Camden, N.J., on October 1. In the absence of Mr. T. J. Drummond, President of the Corporation, Mr. Walter K. Whigham was elected chairman. In calling the meeting to order, Mr. Whigham said that he reported with regret that Mr. Drummond had been ill, and confined to his home for several months past, and that on that account he had now tendered his resignation as a director.

The chairman stated that during the year the corporation and the directors had lost through death the valuable services and counsel of Mr. Herbert M. Price of Quebec. He also stated that Mr. J. Tennall Lea of Philadelphia, who for many years had been vice-president of the corporation, had expressed a wish to be relieved of his duties, and that the board felt with great reluctance that his request must be accepted, as Mr. Lea was entitled to a well-earned rest from the active management.

The following were elected directors: —W. K. Whigham, London; Frederick McOwen, Philadelphia; Herbert Coppell, John T. Terry, Jos. S. Dale, New York; W. E. Stavert, D. U. Newton, Montreal; Thomas Gibson, Toronto; J. Frater Taylor, and W. C. Franz, Sault Ste. Marie, Ont., and A. H. Chitty and James Hawson of Sault Ste. Marie, Ont.

At the meeting of the Board of Directors following the stockholders' meeting, the undermentioned officers were elected: — W. K. Whigham, Chairman of Board; J. Frater Taylor, President; Herbert Coppell and W. C. Franz, Vice-Presidents; Thomas Gibson, Secretary; Alex. Taylor, Assistant Secretary; A. H. Chitty, Treasurer.

* * *

Recent experiments on the flow of air through smooth sheet steel ducts varying in size from 12 in. to 48 in. diameter, at velocities ranging from 1,000 feet to 2,400 feet per minute, appear to show that the average value of the coefficient of friction is 0.00035.

HOLDING THE APPRENTICE.

FAR greater consideration must be given to the holding of apprentices now than was necessary in the early days of engineering, says J. D. Smith, in the "Machine Tool Engineer." It was the general rule then to bind all the apprentices for a term of years by indentures, the parents often being compelled to pay a varying sum of money according to the number of branches of the trade they wished their son to learn. This plan has become nearly extinct, the apprentices being engaged in the ordinary way as required, just the same as fully fledged workmen, although many firms have special methods of dealing with them during their apprenticeship period, some giving a bonus for every completed year, providing a good report is given by their foreman, while others offer inducements such as free entrance fees to evening classes to all those who complete the session course and sit for the examination.

Apprenticeship Systems.

According to the various reports published in the United States engineering papers, one well-known firm of machine tool makers having instituted a system in which the apprentices are engaged by a man specially allotted for the purpose, he also watching their conduct in the shops, and giving them a shift either to a better class of work or to a different department, according to their capabilities or desires, the respective departmental foremen having nothing whatever to do with them apart from giving them their jobs.

This may be right from the management point of view, but it is absolutely unfair to the foreman to hold him responsible for the economy and output of his department if he does not control the means whereby it is obtained. As regards who should be employed in his department he, above all others, should have the deciding voice. It is not inferred that by classing apprentices as "the means" they should be regarded as machines and not as human beings. The human element holds a most important place, and must be considered seriously when any question is raised regarding shop management and methods in connection with bodies of apprentices and men. No apprentice should be dismissed before being called into the office by the foreman and the trouble discussed. Apprentices are not by any means angels in disguise, neither are foremen, but assuming always, of course, that the foreman is a fair-minded man, and is actuated, as he should be, by the thought of what is fair both to his employers and to the apprentice concerned, he should have the power to use his discretion in the matter of either engaging or dismissing the apprentices.

There are always those who enter a department only to find out afterwards that they are entirely unfitted for that particular branch. The best way to overcome this difficulty is to have it perfectly understood before an apprentice starts that in the event of his being unfitted for that particular branch he will be allowed—within a certain time, of course—to apply for a transfer to another department, his transfer to take place as a vacancy occurs. With regard to changing them from one class of work to another, the foreman is the one best fitted to decide when the apprentice is entitled, by reason of his diligence and capabilities, to a move to another machine or bench, their daily connection giving him a far greater insight than one possibly could have who was working the system from an office and controlling the system in every department.

A System With Merit.

I have yet to come across a fairer system than the one which was in force during my apprenticeship days, and I have endeavoured to carry it out to the best of my ability in each shop I have had charge of since, although different parts of the country necessitated slight modifications to suit the district, one country district necessitating the payment of railway fares from the nearest town, on account of the small number of apprentices available in the village, thus bringing the wages paid on a level with those obtained in the town. The firm was a large one of 2,000 hands, the system being in force in every department, no exception being made under any circumstances. It was perfectly understood when the apprentice started that he would be dismissed on attaining the age of twenty-one years; also he must be fourteen years of age, but not fifteen, when starting.

The first rule had the great advantage of automatically making vacancies, the apprentices being arranged as far as possible in half-yearly steps, each getting a move up every half-year, thus making it necessary for us to learn all we possibly could during the time we had at each particular step, as the time once passed could never be regained. The only exception to this rule was in the event of an apprentice continually absenting himself without leave, or continually misbehaving himself during working hours, when the next apprentice following would step over him, and would eventually get the benefit of a longer period at the last and best stage, the culprit never attaining that last step on account of always being one behind. This was very rarely resorted to, excepting when it was absolutely necessary to keep discipline, the fact of the possibility of this occurring having a good effect on the general conduct of the apprentices as a whole, and I am sure the percentage of good men turned out under these conditions will compare very favourably with those turned out under any other system.

Another rule was that one-fifth of the weekly wages was retained by the firm until the apprenticeship was completed, 2½ per cent. compound interest being then added, and the total amount handed to the apprentice, with a letter stating the length of apprenticeship and the experience gained.

One of the reasons given by the American firm for starting their system was that it was said that the foremen did not take any interest in an apprentice who was naturally more backward than his fellows. As regards this, and I think others will support me from their own experience, the more backward an apprentice is, the more interest a foreman is compelled to take, especially if the previous apprentice was of a high order of intelligence, as the less interest he takes so the production will drop in proportion, and if the foreman is worthy of his post at all he will take particular pains to make each different operation quite clear to the apprentice from time to time, knowing that the decreased results from not doing so are a reflection on his capabilities as an organiser and foreman.

CONCERNING INTERNAL COMBUSTION ENGINES.

CARBON deposit in the cylinders and valves of internal combustion engines has always been one of the great disadvantages of this class of motive power, and this is emphasized in the case of the automobile motor because of the frequency with which it is necessary to take down cylinders and remove the valves.

A way of removing this deposit without the necessity of removing such parts has come recently into use. The apparatus employed consists of a tank of oxygen with appliances of such a nature that all parts of the motor can be reached after opening a valve cap or sometimes only a spark plug. When the nozzle is inserted in the opening, the carbon is ignited by means of a taper as soon as the gas is turned on. The deposit is burned away from the metal very rapidly, and, as soon as all the carbon is consumed, the combustion automatically ceases since the gas has had no effect after the cylinders and valves are clean. The metal parts, it is stated, are not affected, and only a few minutes are required to burn away all deposits even when very heavy.

Drill Jig and Fixture Design and Construction

By H. R.

The sketches and data will, the writer hopes, appeal to machine shop superintendents, designers, toolmakers, and novices, as indicating the large place jigs of every kind and for every service occupy to-day in machine shop practice.

THIS article is a continuation of that on clamping methods and devices. There are many ways of clamping down work, and many types of screws and clamp levers. With the demand for speed there has come into vogue a series of levers with which, by pressing down a handle, it is possible to hold down work with rapidity and accuracy, great pressure being also applied. These arrangements can be employed on most types of jigs and fixtures, but are best adapted for use on machined work where the variation is very slight.

To refer to the illustrations, Fig. 95 shows what is called a cam lever for pulling up. This is used in connection with another series of levers. Fig. 96 shows a design of cam lever for pressing down. There is a correct and an incorrect way of designing these cam levers. If they are not made correctly they will always be a source of trouble. The right way to figure them out is shown by Figs. 97 and 98.

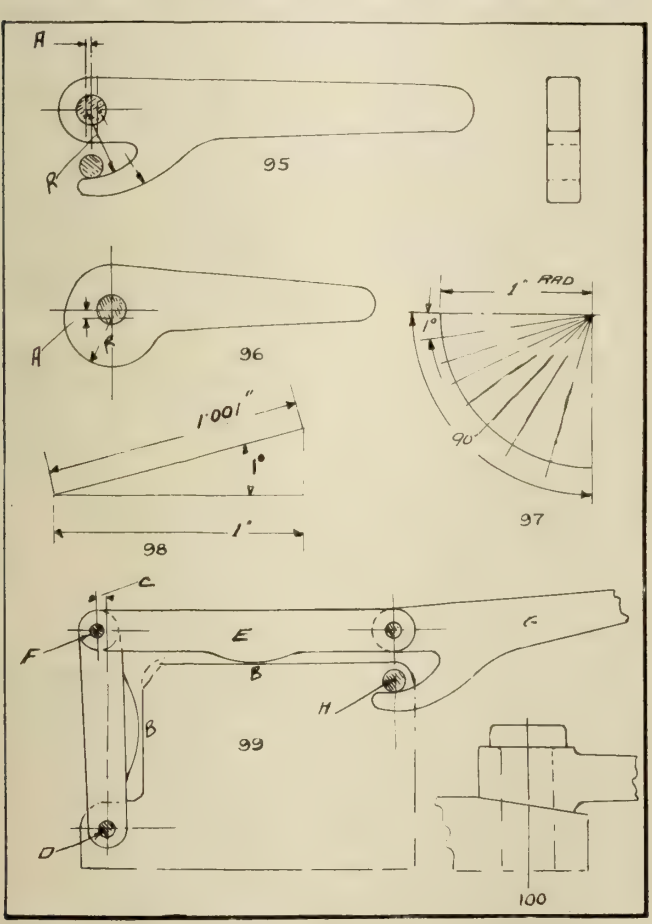
For every degree at 1 inch radius the latter must be out of center .001 of an inch, or as shown at (A), therefore, in designing a correct cam for gripping, you have 90 deg. of gripping surface, and (A) equals 90 plus .001, equals .090 of an inch. If a 2 inch radius cam is required, then (A) will equal .002 of an inch for every degree, or for a 3 inch radius cam (A) will be .003. The formula is not only good for these lever cams, but for straight tapers or wedges, Fig. 98, etc.

Fig. 99 shows a very good arrangement of levers. It will be seen that same can be made so as to grip in two places (BB), or they may be so arranged to pull down on more faces. Referring to the arrangement, Fig. 99, the back link or lever is fulcrumed on pivot (D). A cross lever (E) is fastened to this back lever by a pin (F), and on to the end of this cross lever (E) swings the cam lever (G). The distance (C), referring again to the illustration, should always be about 1-32 of an inch out of the vertical plane of the lever, as this gives a better and more natural pulling action. Very great care should be taken with regard to the pulling down fulcrum (H). The length of the cam lever should be about 4½ times the radius.

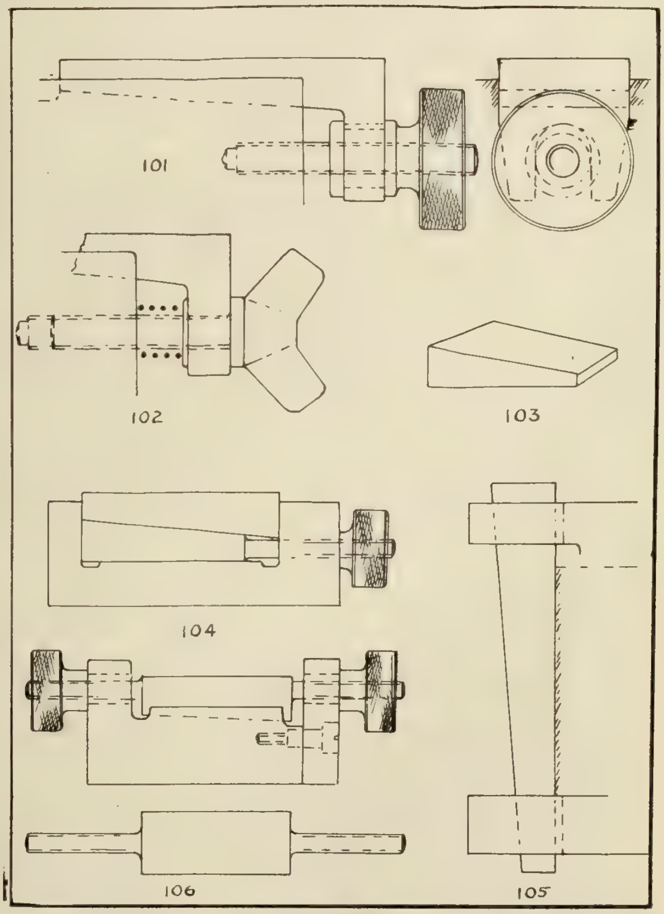
Fig. 100 shows another cam proposition. This is simply a lever with a cam formed on the face, and pulls down with great pressure.

Fig. 101 is a method of pressing on to surfaces by pushing a plate upon a taper surface. In drill jig work this method of clamping will be found very convenient in closed-in places, where it is almost impossible to get other levers or screws. Particular interest should be taken in the construction shown. The operating screw is all self contained. It will be readily seen that this works on a stud screwed into the jig. When this has become worn it can be replaced at little expense. For convenience of fitting, a slot is cut into the adjusting piece. This gives an up and down motion, as same is screwed. If more bearing surface is required, an elongated slot can be made. It will also be noticed that the adjusting nut will work the clamp either way.

In Fig. 102 is shown another adjusting method. The screw is threaded into the jig and the spring releases the clamp.



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.

The method is not good practice, however, because when the screwed hole and screw get worn they are hard to replace.

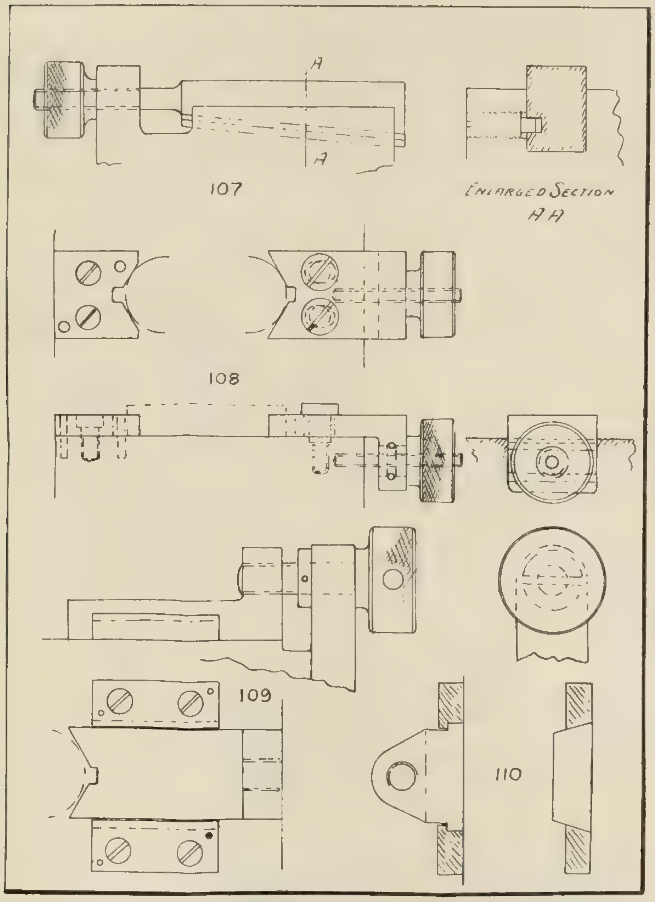
Fig. 103 shows a common wedge which will be found very useful in jig work, and it is well to have a quantity of these always in stock.

Fig. 104 depicts a way of adjusting a surface vertically which will be absolutely parallel. The illustration shows a set of two wedges self-contained. This arrangement is good for milling machine work, but can be equally adapted for drill jig work.

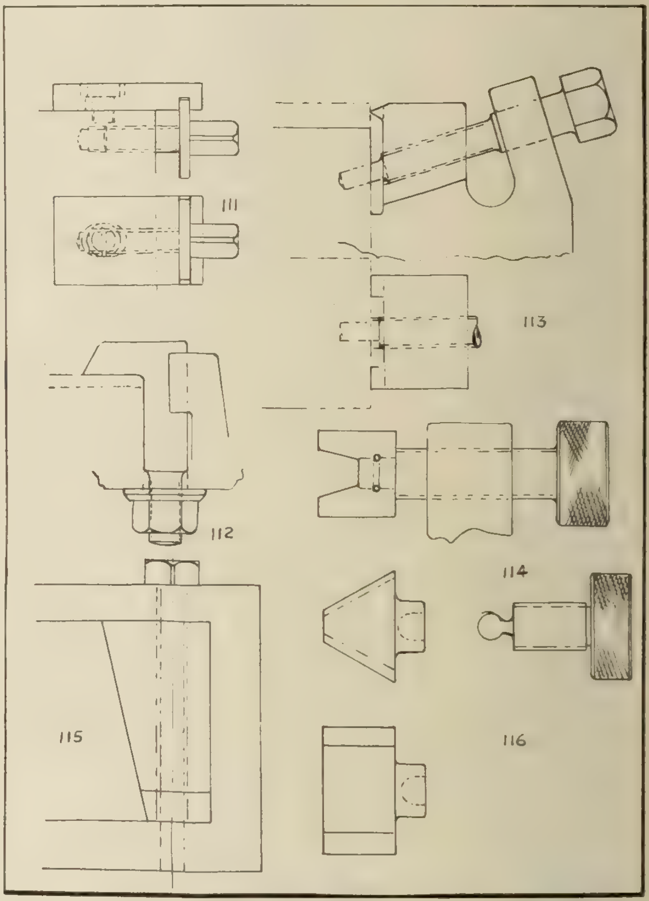
Fig. 105 shows a wedge pushing a component up to its correct face for drilling. The taper for these wedges should be about 12 degrees or less.

Fig. 106 shows another wedge design. This is operated by two adjusting screws and moves in a machined slot. One end is screwed and dowelled in position, which facilitates the machining of the slot, and enables the wedge to be put in position very easily. Sometimes it is necessary to have these adjusting wedges working on a top surface.

The arrangement shown in Fig. 107 is a very suitable device. It will be noticed in the views shown and section, that a slot is cut the length of the wedge. Into this is screwed a grub screw with a rounded end, which keeps the wedge from falling out when turned upside down.



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.

Very often a component has to be located by its ends, as shown in Fig. 108, or by inset bosses. A hardened steel piece is screwed and dowelled in position. This has a vee milled in the end which locates the piece to be operated upon on one end. To locate the other end, a similar vee is cut into a sliding piece. Referring to the illustration, this sliding piece is pushed into position by a screwed nut, and is held from rising by two screws working in two elongated slots. Another method is employed for adjusting the sliding piece either way. A groove is turned around the nut. Into this fit two pins with the sliding piece, thus enabling this to be drawn back or pushed forward easily. The method reduces the distance between the jig and the turned down end of the sliding piece.

In Fig. 109 is shown another way of making these sliding pieces, being held in position by two steel pieces fitted on either side, so that same may slide between them.

In the sections Figs. 110-110a are two of the best ways of making the side pieces, and perhaps it would be as well to remind the designer with reference to screwing pieces on to other parts of a jig or fixture, that care should be always taken about dowelling pieces. This not only squares up a job but takes any strain off the screws. It is always best, if possible, to use taper dowells, as the taper wedge pulls up the work better than ordinary straight pins.

Fig. 111 is another method of adjusting a sliding piece, and very cheap.

Fig. 112 shows the correct way of using hooked bolts, and it will be noticed that the back portion of the bolt is backed up. This is usually done on the casting of the jig. It would be as well to always bear this idea in mind when adopting these particular bolts for clamping down purposes, that there is sometimes required a motion that will not only push the work up to a given face or point, but will also hold the component down firmly. A very good method of doing this is shown. The screw adjusts the clamping piece forward on a taper. As this slides on the taper, it not only presses the component firmly toward its locating piece, but pulls down on to the work. To do this successfully two projecting pieces must be sharpened off, as shown in the illustration.

Figs. 114, 115 and 116 are other designs of wedges for locating purposes that may be useful.

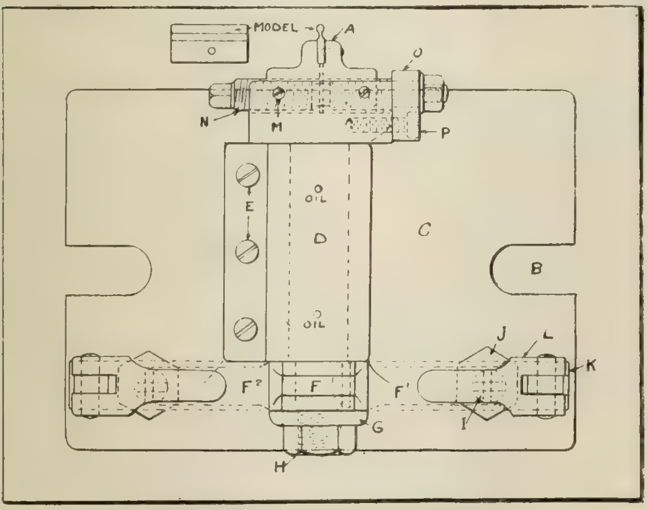
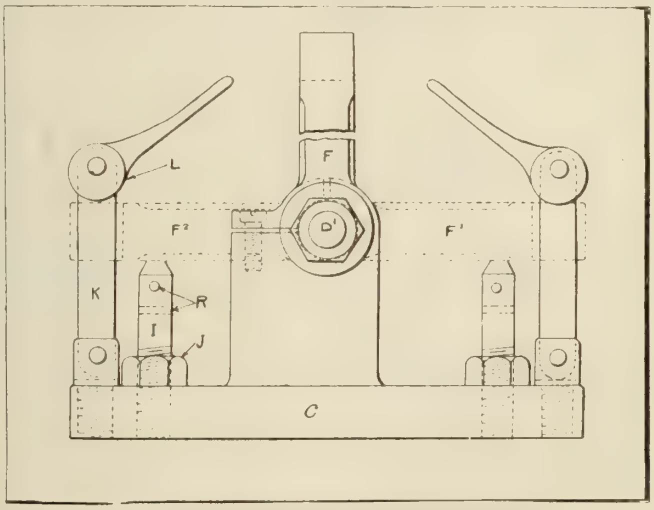
AN EFFICIENT MILLING FIXTURE.

By. A. L. Monrad.

MUCH has been done of late years in the way of developing reversible attachments for milling machines. Most of us are familiar with the flat machine vise and we put a great deal of dependence upon its being parallel, for the quality and accuracy of interchangeable machine work. From that we have improved to the present stage of reversible vise with a perfect adjustable attachment for parallelism. There are, however, some fixtures of this nature on the market which do not possess the quick reversible action necessary for small accurate work. As a number of these fixtures must be in service every day the year around, I shall, therefore, give a brief description of how one was designed and which proved a great success in milling parallel, as well as tapering small delicate pieces of different shapes and dimensions only by changing the sliding jaws (A).



AN EFFICIENT MILLING FIXTURE.



AN EFFICIENT MILLING FIXTURE.

Detail Features.

The fixture is placed on a platen of a hand milling machine with power feed and very close to the head of spindle, to allow the cutter to be short and stiff. The form cutter must run very true sideways, in order to retain its circular shape when milling. Two bolts hold the fixture securely in position through the T grooves in the machine bed and the slot (B) of the fixture. No keyways are provided in the bottom of this fixture, because it has to be changed from taper parallel milling very frequently, and as it has to be set absolutely square. the following method is employed with great success:

Clamp a long parallel piece either round or square in the sliding jaws (A). Place an indicator on the milling arbor between two bushings. Now indicate on the front side parallel piece by sliding the table to and fro, or reversing the jaw vise over in the stationary position. A very slight variation will be shown immediately, and tapering the fixture over half the distance shown on indicator will bring it parallel, when milling a fixture square with the spindle. The fixture plate (C) is made of gray cast iron and finished all over. The spindle hole (D) must be bored exactly parallel with the bottom and square with the front. A 1-16 inch slot is cut through on one side, and the tap is held down to a good bearing surface with three cap screws (E). Both the front and back surface are squared off to a parallel surface bearing. Two oil holes are provided on top for lubrication. The back end of the fixture keyed and fitted.

The arm (F) is secured stationary to the spindle with a washer (G) and a hexagon nut (H), while arm (F) is made of tool steel, slotted, hardened and drawn to a dark straw color. Arm stops (I) are located on each side and directly under the centre of arm (F), when it is extended out. These stops are screwed in the cast iron plate (C), and are held with a hexagon check nut (J). At each side of the stop pins are located the extension cam arms (K). The lower end is screwed down to the shoulder in the cast iron. A tool steel link is pinned in both ends with a free swinging motion, and on top is placed a cam handle (L).

Throwing cam arm (K) out of the slot releases the spindle (D) to be reversed to the other side. The spindle (D) is made of tool steel, with a good bearing fit on both ends. A dowel-tailed slot is milled on the head of spindle about ½ inch deep and ½ inch wide to fit the tool steel jaws (A). A gib is held on one side with two centre screws (M) for adjustment, and is made a snug sliding fit. The jaws (A) are made of tool steel hardened and drawn to a dark straw color. Some of these sliding jaws are fitted with an extra jaw or interchangeable jaws held with two screws. They are thicker to accommodate different shapes of interchangeable work.

Through the centre in the dowel-tailed jaw is fitted a solid right and left hand square thread screw (N). This is made of machinery steel and case-hardened. One end is milled square to fit a socket wrench, while the other end turns in a tool steel extension piece (O), which is held stationary to the spindle head with two machine screws (P). On the other end of screw (N) is fitted a washer and hexagon nut (Q) turned to a shoulder for a good turning fit of screw (N) in the hole of the piece (O). A socket wrench on the square end of screw (N) closes and opens jaw (A).

The fixture is shown with the arm vertical to illustrate it clearer. The dotted lines (F1) and (F2) represent the attachment in a locked position and ready for the milling operation. The reversing action of this milling fixture is very rapid. By throwing the cam to one side you, at the same time reverse the spindle and throw in the cam on the other side. A very fine adjustment can be attained by turning the stop pins (I) up or down, leaving a rod in the holes (R).

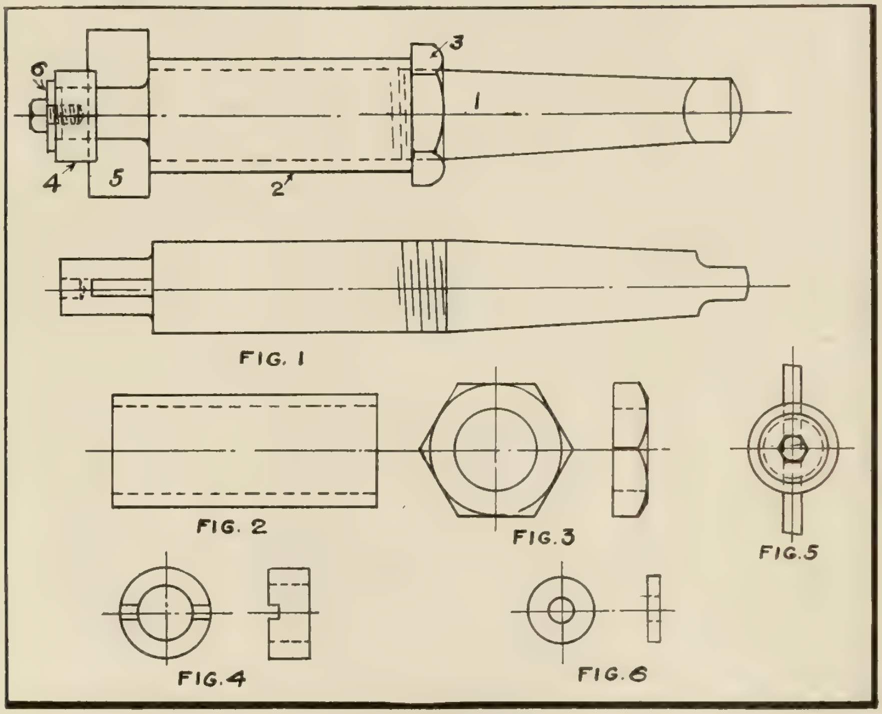
A COUNTERBORING TOOL.

By H. Womersley.

A GOOD service appliance in the machine shop is the counterboring tool. There are various designs in general use, but that here illustrated has been found by the writer to be second to none when it comes to a question of removing material. Fig. (1A) shows a general view; Fig. 1, the bar; Fig. 2, the bush; Fig. 3, the lock nut; Fig. 4, the hardened steel guide; Fig. 5, the cutter; and Fig. 6, the washer.



COUNTERBORING TOOL.

ECONOMIES IN THE DRAFTING ROOM.

By E. W. Tate.

THE lettering on a pencil drawing should not consume too much time, but, nevertheless, should be plainly legible, for in many shops the pencil drawing is often sent into the shop, from which the workman must receive his information. The writer has found, however, that when it is desirable to put a pencil drawing into the shop, a coat of white shellac applied will preserve the drawing. With regard to making drawings directly on tracing cloth or bond paper, this practice may be allowable in some cases; but as pencil drawings have to be sent to the pattern shop, and as it is well known that owing to the shrinkage of blue prints, they are unfit for pattern work, unless all parts are fully dimensioned, which would necessitate another waste of labor, wherein the pencil drawing can be scaled, such drawings would hardly be suitable for pattern or forge shop use.

Other economies which have been found quite valuable are as follows:—

In layout or assembly work, cross sectioning is more quickly done, and the component parts more readily determined by the detailer and tracer if the several parts are lightly shaded with colored crayons. A considerable saving can also be made if the tracing cloth is purchased, cut to desired size, and all standard parts of the title form, except the specific title and skeleton material blocks, printed, thereby not only saving the tracing time, but having the advantage of all titles of uniform style and size.

Tapped holes and standard cap or set screws can be dealt with by a note rather than drawing the complete screw, as is done on a great many drawings.

MOTOR ARMATURE MISHAP.

THE September issue of Vulcan contains a picture of an armature in very bad condition. It is—or rather, it was—the armature of a 55 horse-power series wound direct-current motor, driving haulage gear in a mine. The motor and haulage gear were situated in a small chamber in the mine, but for some reason which is difficult to explain, whilst the motor was working at full load, and, therefore, at normal speed, the band at the back end of the armature burst. Apparently the engineer lost his nerve, and without thinking of the consequence, immediately threw out the clutch, so removing all load from the motor, and then rushed out of the engine-house.

The motor being series wound, as soon as the load was thrown off, the speed increased, and the centrifugal force caused not only the armature windings to fly, but also the commutator spider to burst. When the engineer returned, the machine was a complete wreck, bits of the commutator were lying all over the floor, the armature windings were twisted, whilst the field coils had been damaged by the loose ends of the armature windings catching against them.

Upon further investigation it was discovered that the shaft was bent, and that the core plates of the armature were loosened. It was found possible to utilize the carcase of the machine, but the field coils had to be entirely rewound, and a complete new armature and commutator with shaft fitted. Had the man opened the switch, all this trouble would have been saved.

THE SMOKE NUISANCE.

IN almost every city, especially where manufacturing industries are attended by large volumes of smoke, the problem of abating the so-called smoke nuisance has proved not easy of solution. In many of the methods used for clearing smoke, a "point" or "edge" electrical discharge is used. A discharge of this kind is not uniformly distributed about the point or edge. The discharges cause a slight pressure in the gas, and the smoke or fumes always seek that part of the apparatus where the discharge is weakest or entirely non-existent.

A writer in the Scientific American has made use of a corona type of discharge, and has thus obtained a perfect radial symmetry of the discharge about the electrode. The negative corona is found to be more suitable since slight changes in the position of the corona electrode do not greatly affect the symmetry of the electrical discharges. It is probable that this form of discharge is the most efficient application of the electrical method of removing fumes, smoke and dust from gases.

The use of 300 watts will clean 800 to 1,000 cubic feet of the densest kind of smoke or fumes per minute, with a very small energy loss. The cleaning can be done by passing the gases through 4 ft., or even less, of the corona discharge. The voltage is about 28,000.

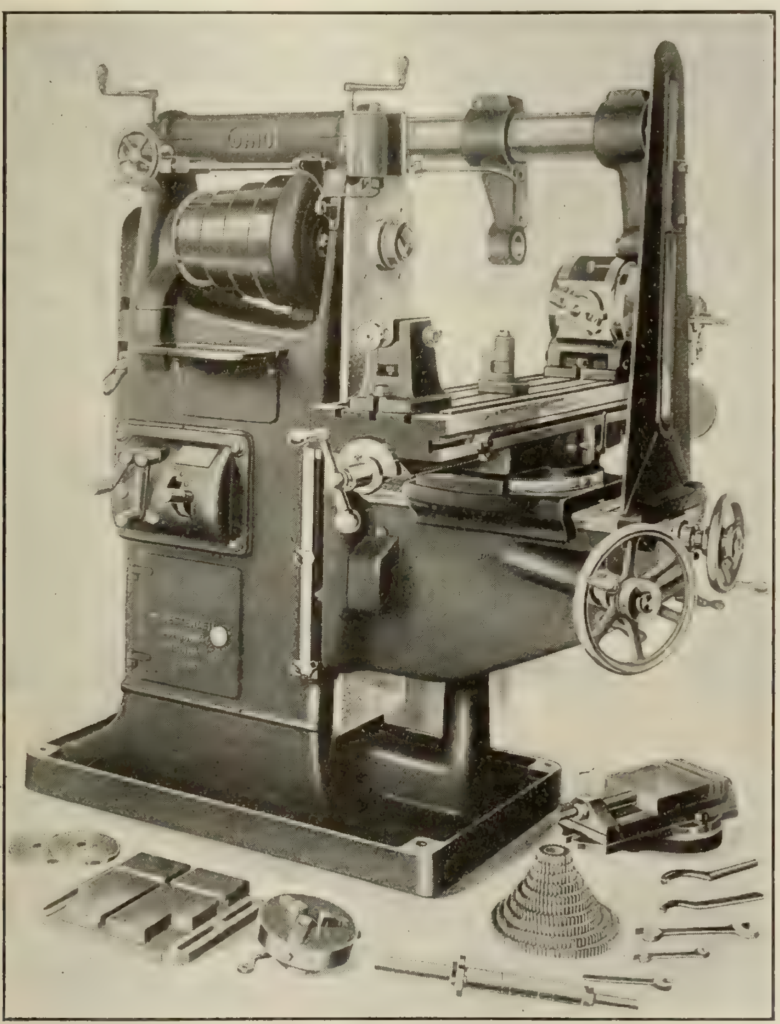
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

MILLING MACHINE IMPROVEMENTS.

THE unit system of construction now generally adopted in machine tool design has opened the way for further economic developments, and a step has been taken by the Oesterlean Machine Co., Cincinnati, Ohio, in their new designs of cone type millers, which they style "Ohio" model, embodying the following points:—

The large table and table mechanism of the "Plain" type machines has been adapted to the "Universals," and is now being used on the "Plain" and "Universal" alike. The entire knee and knee mechanism is made identical for both; in fact, instead of building the "Universal" millers of entirely different dimensions from the "Plain," there is only one machine to build which may be made "Plain" or "Universal" by employing or leaving out the swiveling saddle. It is readily understood that a large saving is thereby effected both from the jig expense standpoint and that of manufacturing in larger quantities.



"OHIO" MODEL CONE TYPE MILLER.

In the "Ohio" millers a unique belt shifting device is applied, which makes it safe for the most unskilled operator to care for the changes of speed rapidly without fear of bodily injury. One complete turn of the hand wheel on the machine runs the belt from the centre of one step to the next consecutive step on the machine cone, and a simple lever carrying a straight line motion link places the belt in desired position on countershaft cone. By this method, the required speed is obtained instantly without making any intermediate changes.

"Ohio" millers are supplied with a cone, the smallest step of which is so near in size to the largest that it approaches constant horse-power for a given countershaft speed. The back gear is eccentrically mounted on a shaft below the spindle in the column, and the gears being cut with single purpose cutters run silent under all conditions. The spindle is supplied with continuous lubrication from oil wells cast in the column.

The method of positive driving the arbor is obtained by means of a recess across the nose of the spindle, and being alike on a number of sizes makes all cutters and tools on these sizes interchangeable. Automatic flooded lubrication set up by the gears revolving and dipping in oil is the method employed for lubricating the entire feed box mechanism. All gears and shafts in gear box are hardened and ground, and run in bronze bearings. These machines are built in five sizes plain and five sizes universal, our illustration showing the latter.

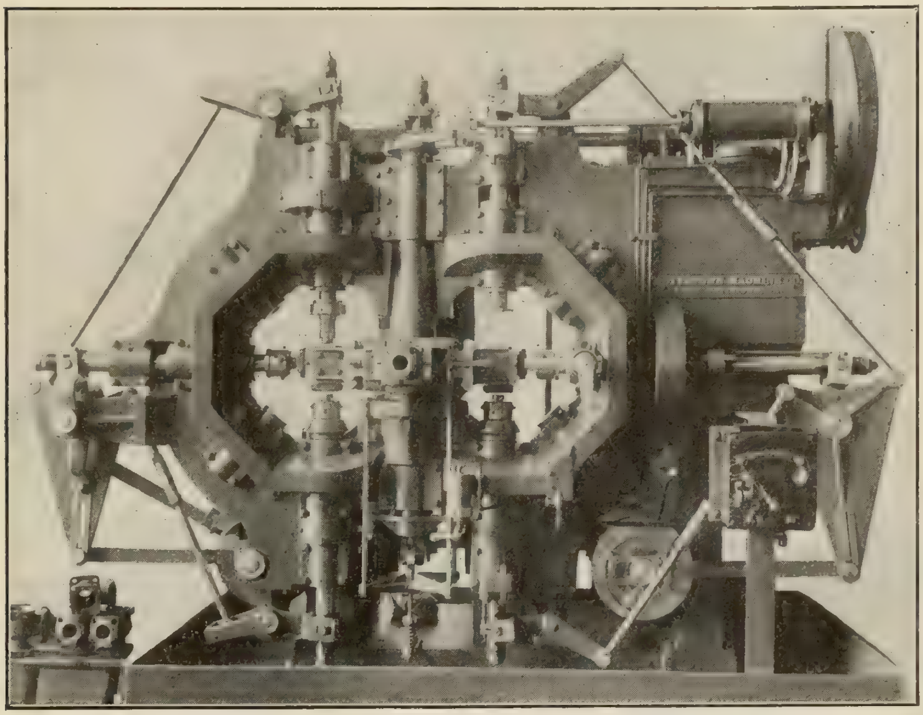
AUTOMATIC VALVE TAPPING, REAMING AND SEATING MACHINE.

THIS machine is intended for finishing semi-steel ammonia valve bodies, flanged and screwed ends, also split return bends and similar work requiring two or three operations in one chucking. The machine is of the upright type, of heavy construction, and would be styled a semi-automatic. A strong feature is the rigidity of the parts, entirely eliminating the shift of work while under operation. The machine is equipped with eight spindles, of which one or all can be used as required.

The turret is revolved and indexed by a pneumatic cylinder, and has four sides provided with four chucks, three of them being under operation, while the fourth is being filled. The first operation is on the left, where the three roughing tools enter the valve, removing all scale surfaces. On the second movement of the turret, this valve comes under the finishing tool, which is located in the rear, but does not show in the cut. Two spindles are provided in the rear, one horizontal and one vertical, providing a finishing tool for either style, whether angle or straight through valve. On the third position of the turret, the two facing tools finish the male and female openings. On the fourth movement, the turret is brought around to the loading point, where the finished fitting is removed and the new blank inserted.

On the right hand side is furnished an additional wrist plate, cam and lever mechanism. This is the tapping side of the machine. It is possible to throw the automatic reversing mechanism out of commission, making the spindles travel in one direction only, which permits placing finish facing tools in these spindles for flange work. The cut shows the machine operating in this manner. By disconnecting the wrist plate, placing lead screws on the spindles, and throwing the reversing mechanism in commission, the machine is ready for tapped openings. While the turret is held and indexed by a substantial latch bar, it is further held by an automatic gripping device, which makes it absolutely rigid with the main frame of the machine, insuring alignment and accurate work. It is possible to revolve the turret entirely around without the tools operating on the work as long as the cam trip has not been pressed down. After the work is placed in the chuck and the turret moved to its first position, the machine passes through the cycle finishing the piece. Once the tools have been set, there is nothing further to be done but to take out the finished work and put in the new blanks. The machine is adjustable in every needed way, covering all ranges of work, from the largest to the smallest.

The chucks, to secure rigidity, are provided with right and left screws that are coupled in the centre with a sleeve to receive the two ends of the screws which have a square to fit this sleeve. The action of the wrench on the one end of these screws is to tighten the jaws on the fitting, which will then cause the screws to separate slightly in the middle, and bring up solidly at each end of the chuck. Therefore, when the work is fastened in the chuck, it is as solid as the turret itself.



4-INCH AUTOMATIC VALVE TAPPING, REAMING AND SEATING MACHINE.

Solid taps are used, and the taps are fed in by adjustable lead screws. In order to facilitate gauging, the leader nuts are castellated and, with a spring latch, the nuts can be revolved from one notch to another, regulating the depth of thread. The lead screws are removable, and can be readily changed for different pitches. The taps are started automatically by the cam shaft, but the reversing is done by the stop on the reversing discs. Any depth of thread can be cut by simply adjusting the stops. The variation in the threads is adjusted by the lead screws, as previously explained.

This machine has many advantages, the first being the construction of the machine itself. With the four-sided turret, the work is brought closer to the operator, giving him every chance for thorough chucking. The simplicity with which the machine can be set up for doing the different jobs is also a great advantage. In starting on a piece of work the turret can be moved back and forth to the different tools, thus doing all the trying and gauging on the first piece. The machine performing the third operation is a feature entirely new. For the machining of a globe valve body, it provides roughing tools to take off the stock and rough reaming, and finishing tools for accurately finishing all the openings, including the seat, with one chucking. As a consequence, it is obvious that the work will be better, the tools last longer and require less setting up.

All gears are made of cast or forged steel with cut teeth; all clutches are made of tool steel, hardened; spindles are of special spindle steel, and are provided with taper sleeves and bushings for taking up wear; all bearings are of ample width and provided with oil grooves and oil holes conveniently placed; and all working parts are arranged with a view to obtain quickness of operation, a feature much to be appreciated The hand levers for the various movements of the machine are placed conveniently at the front, while the output depends upon the material and the tools used. On 2-inch semi-steel valve bodies the output obtained is 20 per hour, with smaller sizes proportionately greater. The floor space oc-

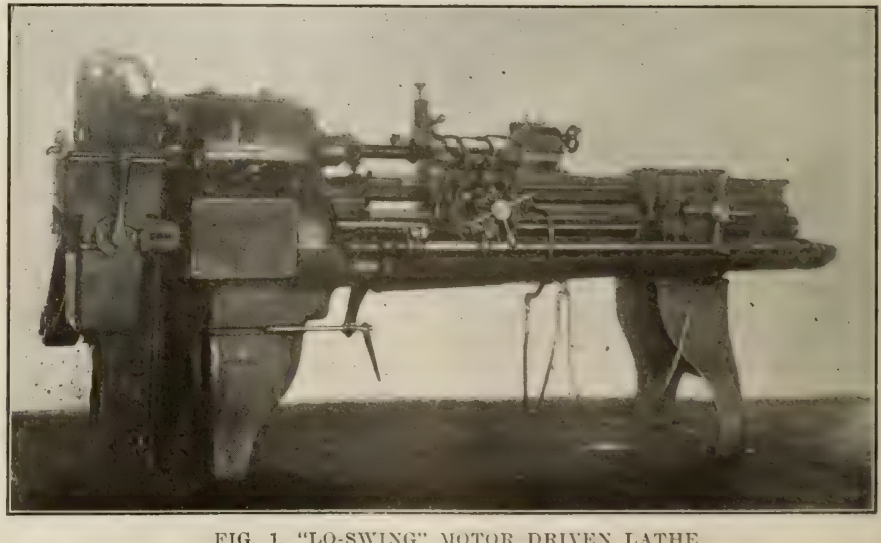


FIG. 1. "LO-SWING" MOTOR DRIVEN LATHE.

cupied is 9 ft. 6 in. by 6 ft. 1 in., and the weight 20,800 pounds.

The Pottstown Machine Co., Pottstown, Pa., are the makers of this specialty.

"LO-SWING" LATHE TEST.

THE Fitchburg Machine Works, Fitchburg, Mass., recently ran a series of tests to determine the motor horsepower required to turn electric motor armature shafts and the average time per shaft. The shafts, 24 21-32 inches long, 2 inches diameter, were of 0.30 point carbon steel, being what is commonly known as "machinery" steel. The rough diameter of the stock was 2⅛ inches. The record of these tests is valuable, as they indicate the great economies that can be effected in machine shop practice by the use of "single purpose" machine tools developed for repetition work required to be machined in large quantities.

Test Equipment.

The tests were run on a "Lo-swing" lathe equipped with the typical tool rests and turning tools used on this machine for shaft turning. The tool rests of this well-known machine tool are so constructed that there is only one slide between the tool and the lathe bed and, therefore, only one oil film between the bed and the cutting tool. This rigid support for the tool enables the machine to take heavy cuts without chatter. The tool arrangement comprises multiple tool rests, all supported directly on the ways. These tools are adjusted at certain distances apart, depending on the length of the different diameter sections of the shaft being turned.

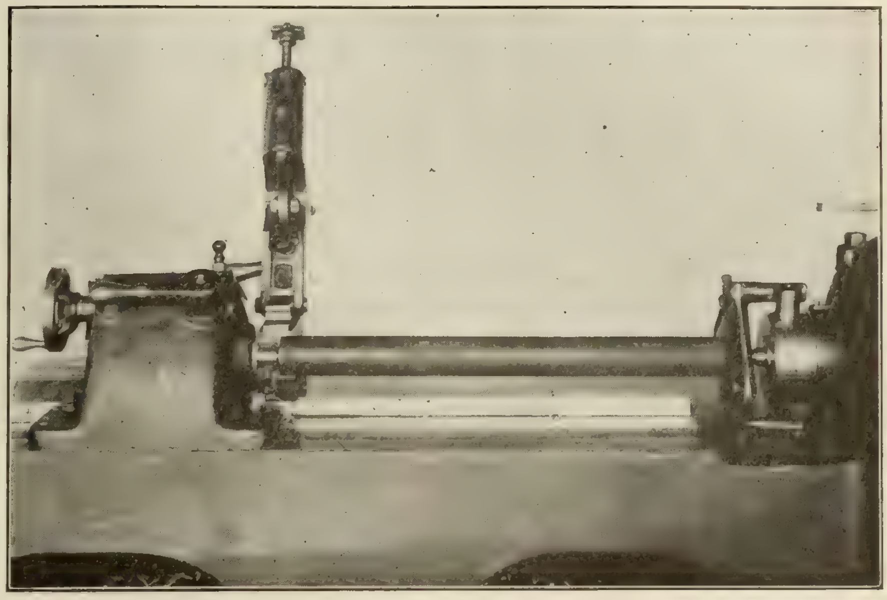

FIG. 2. READY TO START CUTTING WITH FIRST TOOL.

Test Features.

Fig. 1 shows the lathe set up for the test. It is driven by a 10 H.P. Westinghouse motor, running at 1700 R.P.M., mounted on the back of the headstock leg and belted to the constant speed pulley. The controller is in front, convenient to the operator. The readings of power consumption were taken on an Esterline recording wattmeter which makes an autographic record consisting of a series of dots instead of the common unbroken line.

To have produced the turned shaft on an engine lathe would have required eight distinct operations. With the "Lo-swing" lathe the cuts on each end are taken progressively, four diameters being turned simultaneously when the tool cutting the smallest diameter goes into

No tools cutting..	0	0	0	1.2
Tool 1	1-32	1.00	127	2.0
Tools 1 and 2.....	5-32	5.54	107	3.8
Tools 1, 2 and 3..	1-32	6.36	60	4.8
Tools 1, 2, 3 and 4	1-32	7.14	43	5.6

action. The work speed was 250 r.p.m., or 131 lineal feet on the 2 inch diameter, while the feed was 50 turns per inch. The power required to overcome the friction of the motor and machines was 1.2 h.p., and when the first tool went into operation the power consumption rose to 3.1 h.p., the depth of cut being 9-64 inch, and the amount of metal removed 4.26 cubic inches per minute. When the second tool began cutting, the power consumption rose to 4.2 h.p., the metal removed then being 5.54 cubic inches for both tools. The progression of cuts and the corresponding power consumption and total metal removed per minute is given for one, two, three and four tools in Table 1, while Table 2 gives the corresponding data for the turning operations on the other end of the shaft. The time required for the first multiple turning operation was 2 minutes and 54 seconds, and for the second multiple turning, 2 minutes and 6 seconds. The total time required for turning five shafts, including the changes, was 35 minutes and 20 seconds, or an average of 7 minutes and 4 seconds per shaft. The shafts, of course, were rough-turned, the finishing being done on the grinding machine.

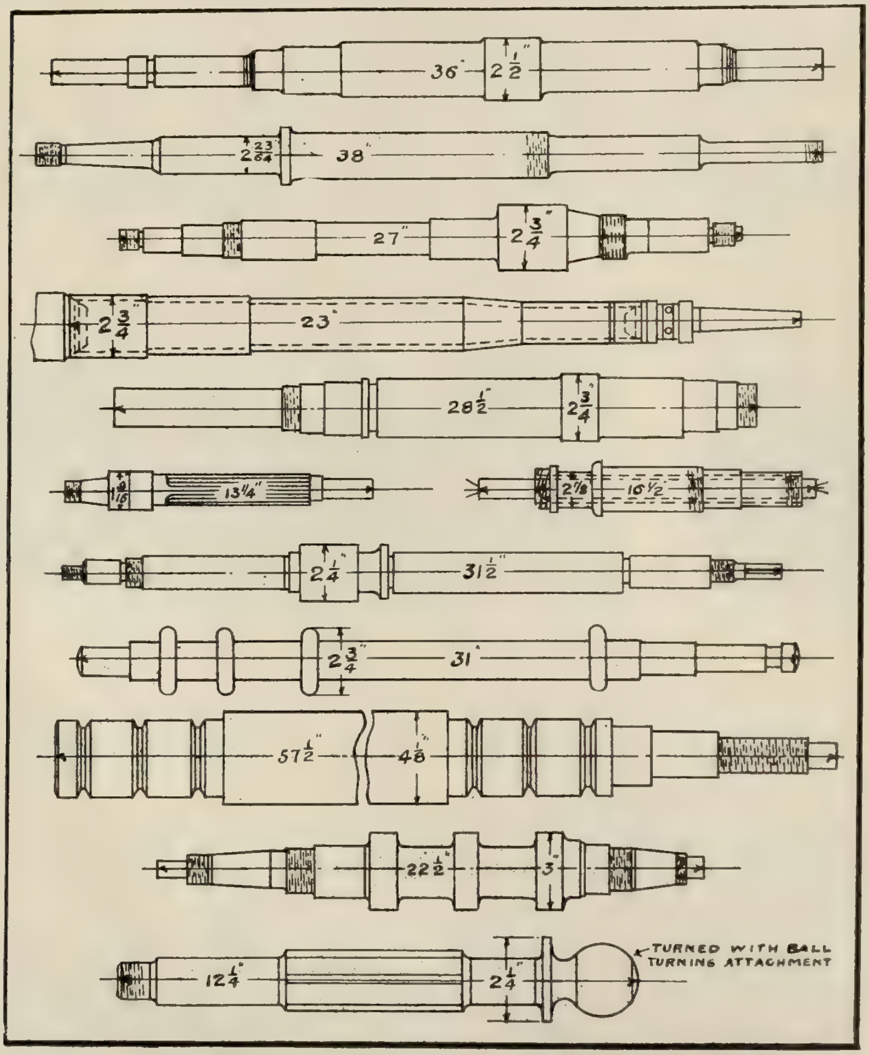

FIG. 7. SHAFT SUBJECTS TYPICAL OF "LO-SWING" WORK.

The foregoing is a typical example of work for which this single purpose tool is adapted, and the use of single purpose tools should become more general as their advantages over general purpose tools are more fully appreciated.

Lathe Features.

The Lo-swing lathe specializes on turnwork up to 3½ inches in diameter, and 90 per cent. of all shafts having several shoulders and one or more tapers are within this limit. Special features relative to the operation of this machine are: Constant speed single pulley drive; automatic measuring device; automatic taper attachment; continuous flow of cutting compound on as many tools as are in operation; two carriages, one or both of which may be used, depending upon the length of the work; the swivel drive with double tail dog for high speed work on heavy cuts; the use of several tools cutting at one time; construction which prevents "chattering," and preserves the cutting edge of the tool; ease and simplicity of operations.

The "Lo-swing" lathe is made in 3 lengths of bed, 60 in., 84 in., and 108 in. between centres. The all-geared head runs in an oil bath; there is an all-gear feed; the gear pump and piping will supply compound to 6 cutting tools, the swing over ways is 4⅞ inches, and the swing over the carriage (to turn a rough bar) is 3½ inches.

H. W. Petrie, Ltd., Toronto and Montreal, are the Canadian selling agents for the Fitchburg "Lo-swing" lathe.

◆

FATAL BOILER EXPLOSION AT COLLINGWOOD.

A FATAL explosion occurred at Collingwood on the afternoon of September 23, W. and F. Shell were at the Blackstock farm looking at a threshing machine, boiler and engine, which they thought of buying. The Blackstock brothers, Edward and Neil, raised steam to demonstrate the fitness of the boiler, when the steam reached 80 pounds, the boiler suddenly exploded, tearing in two about the middle. One part shot forward about 25 feet, and the other backward about 45 feet over the fence into an orhard. Edward Blackstock was struck by the latter part and died a few minutes later. His brother was severely injured, but will probably recover. The Shell brothers were unhurt though standing close to the side of the boiler when it exploded.

◆

Winnipeg, Man.—The ratepayers on October 1 carried the by-law providing for an expenditure of $13,000,000 for a new water supply. Work will be started on the proposition at once. The water will be piped from Shoal Lake, near Kenora, Ont.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada
To Achieve and Maintain a Dominant Place in the Markets of the World

ECONOMIC EFFECTS OF PANAMA CANAL.

GREAT interest was taken at the Birmingham Meeting of the British Association on September 17, in a paper read by Adam W. Kirkaldy, Professor of Finance, Birmingham University, on the economic effects of the Panama Canal, in the course of which he treated the subject with great thoroughness.

Prof. Kirkaldy said that such effects could be easily exaggerated. So far as the outside world is concerned, he said, the greatest effect of the opening of the canal will probably be to get commerce and trade out of the groove, and cause an all-round modernization of business methods. The old will have to be scrapped, friction among the factors of production will have to be eliminated, and capital and labor in competing countries will have to learn to work harmoniously together. Socially and economically this will effect a very great result. Is it what America dreamed of when she entered upon this stupendous undertaking?

Two-fold Effect.

The author of the paper is a recognized authority on economic questions. In his address he treated his subject under the two general heads of local effect and effect on world-trade. From the industrial point of view, he said, three questions arose; who shall supply certain markets, who shall perform the service of transport, and what routes shall shipping take. The principal factors on the balance of advantages on which the foregoing questions would be decided were, distance; tolls on the route; freights and the possibility of continuous freight-earning; fuel stations; insurance rates; the political factor; rates of exchange; investments of capital and banking facilities; the human factor — manufacturing and commercial ability, experience of trade and markets, and present possession.

Local Effect.

The canal, he said, will add enormously to the commercial facilities between the various regions of the American continent and the adjacent islands, hence important developments may be expected. The West India Islands will enter upon a new period of prosperity, especially when the internal combustion engine takes the place of steam and oil replaces coal. English business and fiscal methods will have a great effect on making the West Indies important to shipping, and thus assist the development of local industries, especially the export of raw material. The comparatively unprogressive states of Central and South America will undergo remarkable developments owing to increased immigration of Europeans and increased trade. These local benefits will be the chief, and ample, justification for the construction of the canal.

Effect on World Trade.

Of the effect on world trade, he continued: America realizes the importance of the coal trade to the United Kingdom, and there will be a strenuous attempt to displace British coal throughout the world, in order to give American shipping the advantages at present enjoyed by British. If successful this will deal a mortal blow at Britain's mercantile marine. Thus, the British coal industry must realize the situation, and both the capital and labor interested resolve to hold the market at all costs until the fuel question—coal or oil—is finally settled.

The Tolls Feature.

The published scheme of tolls, which frees American coasting ships, raises an international question. If the canal be worked on business principles, higher tolls will be exacted from other shipping. This will either cause a grievance or decrease the tonnage using the canal. The question might be made domestic instead of international, if America charged equal tolls to all, and gave bounties to such shipping as it wishes to favor.

The Distance Effect.

As to the effect of distance, he thought that on Australasian and Far Eastern markets it would be considerable, as the mileage run by a steamer was a serious factor in cost of service. In this, shipping offered a contrast to railways, for when trucks were loaded, length of haul had but litle effect on cost of service.

Taking London and New York as the typical European and American ports, he said, the markets of the world fall into three classes—

(1).—Countries in close proximity to the canal; here the effect will be greatest and, in many cases, the use of the canal a necessity.

(2).—Australasia and the Far East. At present there is a choice of routes to these markets; Panama will offer another alternative.

(3).—Ports not directly affected.

Class 2 is receiving most attention from those estimating the effects on world trade. There is a parallel equidistant from London via Suez, and from New York via Panama. On the South Coast of Australia this is Port Lincoln, Adelaide being the nearest great port. All Asiatic ports west of Japan will continue to be nearer London, e.g., Manila will be 2,000 miles nearer, but all Japanese and New Zealand ports and all Australian ports east of Adelaide will be nearer New York. If it costs 50 cents to transport one ton of goods 1,000 miles, distance saved will give American manufacturers an advantage of from 50 cents to $1.80 per ton on all goods supplied to ports between Melbourne and Wellington, N.Z.

Differs From Suez.

Panama differs from Suez in the matter of tolls. Suez had an immediate monopoly; with Panama there is in many instances a choice of routes and high tolls will deflect tonnage.

Freights.

To benefit American shipping, freight must be available both out and home. To benefit American manufacturers, freights must be low. At present Europe supplies Australasia with manufactured goods, and the shipping goes via Suez. This route gives a maximum of trading possibilities and great facilities for coaling. The Cape route, too, offers to fully loaded steamers the advantage of cheap bunker coal. For the homeward voyage from Australasia a partly loaded steamer goes via the Horn to pick up cargo at ports like Monte Video. The canal would not attract these ships.

When Panama is open, will all-round-the-world services be organized? Great Britain is in a better position to do this than any other country. The rumors current recently that an existing shipping combine was trying to arrange an amalgamation with one of the oldest Far Eastern shipping companies were probably due to the hope of being able to commence such a service, having some of the chief trades of the world as tributaries, from the moment that Panama is available. America hopes to open up new markets, e.g., wool. This now concentrates at London, but there is a tendency towards decentralization, and if America develops the woollen industry, she will get a wool market without necessarily constructing a Panama Canal.

Fuel Stations.

This will be one of the decisive factors, and lead to the keenest commercial rivalry. The American Government are planning to supply good coal at either end of the canal at 19s per ton. The English coal on the Suez route is at present much dearer; to maintain the Suez route in its integrity, the supply of cheaper coal is a necessity. When oil replaces coal, the British Empire resources will be ample to maintain our commercial position, but this must not in the meantime be placed in jeopardy, or disaster may ensue.

The Political Factor.

The working of the Imperial idea in Great Britain, America and Germany should be noted. Preference granted by the Dominions has materially assisted British trade. The possession of the Philippines has displaced Spain from the position of chief trader there in favor of America. The importance of this factor can be traced in the case of Japan, and China, when settled government comes, will be another notable instance.

Rates of Exchange.

The Far East has a silver, Europe and America a gold standard. Rates of exchange effect trading relations. The whole question should be carefully studied. About seven years ago, when a Chinese merchant could get exchange on the West Coast of America at the rate of 119 taels for $100 gold, it paid him to import thence timber and flour; but at present rates—namely, 160 taels for $100 gold, this ceases to be profitable business, and he can trade to greater advantage locally. This factor works independently of trade routes.

Investments and Banking.

Great Britain is a great creditor nation. Her advances have been really made in goods, and though the interest has to be paid in gold, it comes in goods covered by bills in terms of sterling, so that investors get their interest in gold. The British, too, have banking establishments all over the world. London is the great settling place for international trade. All this gives England a very great advantage. Germany has followed England in this.

Finally, the Englishman is, roughly speaking, the man in possession, and though at one time he seemed somnolescent, at present he is very wide awake. He has many advantags for the transport services; cheap, economically worked ships, also carefully organized trading facilities throughout the world, and the knowledge and experience which enable him to retain old trades and be the first to enter new ones.

So far as retaining the markets for manufactured goods is concerned, he has an unrivalled labor force endowed with hereditary skill. He can get the pick of the raw material, thanks to his knowledge of markets, and a fiscal policy which favors England as a buyer of raw and semi-manufactured materials.

Finally, British goods are known all over the world for their quality. Honest goods and honorable dealing on the part of the seller are their own market.

"MADE IN IRELAND" TRAIN.

THE Canadian Associated Press understands that a "Made in Ireland" train, under the auspices of the Irish Chamber of Commerce, is about to tour the Dominion. Specimens of Irish manufacturers will be transported from Belfast to Quebec by way of the Empress steamers from Liverpool. At Quebec, a C. P. R. train, consisting of ten sample cars, will be fitted up with exhibits, and sent for a trip over the three transcontinental railways, as far as Calgary, returning via Montreal and St. John, N.B. At the latter port, the exhibits will be reshipped for Liverpool and Belfast.

The round trip, it is estimated, will cover about 12,000 miles, and will take up from 75 to 80 days. Arrangements have been made with the C. P. R. that the cost of each car shall include all expenses of the entire trip from and to Belfast, including maintenance charges for the four attendants allowed to each car.

PROGRESS AT PORT NELSON.

WORK at Port Nelson, the terminus of the Hudson Bay Railway, is progressing rapidly, and the Department of Railways and Canals have succeeded in placing there enormous stores of equipment and supplies necessary to carry out the plans. These latter call for a continuation of the work all winter, so that when the Hudson Bay Railway is completed, facilities at the terminus will be adequate to care for the immediate traffic.

Two hundred men are now at work, and will continue all winter. They are engaged in building quarters, docks, storehouses and railway yards. Supplies already forwarded are all that are necessary for the work. They include locomotives, steam shovels, timber, rails and other material necessary for railway or dock construction.

Vessel Service.

Early in July the Government tugs Kathleen and Neophyte left for Port Nelson and will remain there on the work. The steamers Belleventure and Buonaventure also left about the same time carrying supplies, men and machinery. The Belleventure has returned, and is again going north with a cargo of coal, accompanying the dredge Port Nelson, built in Toronto, for work in Port Nelson harbor. At noon, Friday, September 12, the Department of Railways and Canals was notified by wireless that they had reached a point about 150 miles east of Belle Isle Straits, after having had very severe storms from Cape Breton to Gaspe and through the Straits of Belle Isle. The Buonaventure left on its second voyage on September 17 with a cargo of equipment and supplies. She will be the last steamer sent north this season. A powerful tug purchased in Glasgow, Scotland, sailed for Hudson Bay on September 6th, and is expected in Port Nelson in a few days. A number of barges to assist in the dredging have also been sent into the bay and arrived there successfully.

Two steamers, the Alcazar and Allette, sailed from Port Arthur, Texas, on July 15, carrying 4,000,000 feet of Southern pine to be used in construction of docks and wharves. This timber is especially adaptable for the work owing to its durability. The cost was also less than if obtained inland, as the continuous water transportation made freight charges very light. These steamers are now unloading at Port Nelson. The steamer Serence carrying coal, and the Sinbad, loaded with machinery, are also unloading at Port Nelson, and are expected to return about October 1st.

In all ten vessels have successfully navigated the Straits without an accident, and two of these are making a second voyage. This in itself is the best of evidence as to the feasibility of the route, but it is much stronger when it is considered that the safeguards to navigation are not so numerous as on the older trade routes, and that the voyage was the first into these waters for most of the officers of the vessels engaged in this work.

Wireless Communication.

To secure communication with Port Nelson, a wireless equipment was shipped on one of the steamers, and is now being erected, when communication will be established with Le Pas, the starting point of the Hudson Bay Railway, where a similar wireless station is nearly completed. By this means the Department of Railways and Canals will be in close touch with the work at Port Nelson at all times.

Next year work will commence on a rapid transfer elevator to handle the grain which will seek the European market on the opening of this route.

SOO CANAL ENLARGEMENT.

As a preliminary to the enlargement of the Canadian canal at Sault Ste. Marie to a depth of 31 feet, the Government is arranging for the expropriation of Whitefish Island, and an additional strip of land along the south side of the present canal. Most of the property is owned by the Algoma Central Railway, and the Department of Justice is now instituting expropriation proceedings. Although there was no vote passed at the last session of Parliament for this purpose, the Minister of Railways and Canals, Hon. Frank Cochrane, is taking prompt action to secure the land when it can be got for a comparatively small amount, and before contemplated investments by private parties are made, thus rendering the property more valuable. The actual work of enlarging the canal must, of course, wait until sanctioned by Parliament, but it is understood that a vote will be asked at the next session for a preliminary survey and for the preparation of plans.

The Next Step.

The enlargement of the Soo Canal is a logical sequence to the enlargement of the Welland Canal. The next step will be the enlargement of the whole St. Lawrence canal system so as to give a continuous thirty-foot channel right through from the head of the lakes to the Atlantic. That is the big scheme which Hon. Frank Cochrane is reported to have in view, and which the Government, it is said, will adopt. The formal announcement of the whole scheme will probably not be made for some considerable time yet, but meanwhile the enlargement of the Welland and the Soo Canals will be proceeded with.

* * *

STATE REGULATION OF CANADIAN FREIGHTS.

Mr. W. B. NOBLE, of Cairns, Noble & Co., has contributed to the Newcastle Daily Journal a decidedly interesting article on the subject of Canadian freights. To begin with, Mr. Noble recalls the fact that some two years ago the Dominion Government approached the British Board of Trade in connection with the proposal to institute a system of State regulation of the adjustment of ocean rates of freight between this country and Canada. The proposition, he tells us, does not appear to have found very much favor with the Board of Trade, but that Department expressed a willingness to co-operate in any investigation or inquiry which the Dominion Government might think fit to institute. That, of course, is exactly the sort of thing the Board of Trade would do, although it must be admitted that in this particular instance their peculiar methods have been all for the best.

We do not want Governmental regulation of rates of freight. Such a system would be as grossly unfair as Governmental regulation of the price of newspapers.

The H. L. Drayton Investigation.

Mr. Noble goes on to say that an investigation has been carried on by Mr. H. L. Drayton, K.C., chairman of the Canadian Railway Commission, but it is not quite clear as to whether this gentleman is acting on behalf of the Dominion Government or conducting an inquiry of his own. According to Mr. Noble, the individual who is making most trouble is the Canadian flour miller, who declares that he cannot obtain a price in this country which will give him a fair return and make milling in Canada a profitable business. It is alleged that the steamer rate on flour is excessive as compared with that on wheat, and in this connection Mr. Noble gives it as his opinion that "very little difficulty would be experienced in justifying a differential of 60 cents per ton."

Another point, he states, which is exercising the Canadian mind is that all benefits under the preferential tariff are said to have been destroyed by the high rates demanded by the steamship lines on west-bound goods, and he then gives the following table, showing the approximate value per freight ton of the preferential tariff according to a few of the chief articles of value imported into Canada:

	Value.		%	Preferential.		Rates 1910	Rates 1912	Inc.
				s. d.		s. d.	s. d.	s.d.
Woollen goods	£ 90	per 40 c. ft.	5	90 0	per 40 c. ft.	27 6	30 0	2 6
Cot. piece goods	80	"	5	80 0	"	22 6	30 0	7 6
Carpets	50	"	5	50 0	"	20 0	25 0	5 0
Felt Hats	30	"	7½	45 0	"	15 0	20 0	5 0
Cutlery	150	"	7½	225 0	"	25 0	35 0	10 0

Still another question, says Mr. Noble, is that of tramp tonnage, merchants in the Dominion complaining that such tonnage is now a negligible quantity, and that they are in the hands of a monoply wielded by the conference lines. Surely it is time that this silly old grievance was abandoned by merchants. So fas as those in the Dominion are concerned, Mr. Noble very pertinently points out that if they wished to charter a tramp for the carriage of their goods, they would have to pay a rate 8 to 10 per cent. higher than that charged by the regular lines, and also that they would have considerably more stringent terms in the charter-party, and would probaly be mulcted in higher insurance rates.

What the merchants—not only in the Dominion, but in other parts of the world as well—want is, of course, an entirely open freight market, coupled with the regularity and other benefits conferred by the conference system; or, to put the case more forcibly, they want to have matters all their own way. It would be rather interesting to know, though, how some of them would have been placed during, say, the last two years or so, if the "monopolies" of which they complain had been non-existent, and the entire shipping trade of the world had been subject to the fluctuations of the freight market.

Proceeding, Mr. Noble sets out three proposals which have been put before the Dominion Government. These are: (1) that ocean carriers should be treated as, and, if necessary, legislated into, the position of common carriers; (2) that the Canadian Government should form a fleet of vessels of their own for the conveyance of East-bound produce and West-bound merchandise; (3) that powers under the three-mile limit of territorial jurisdiction should be exercised in connection with steamers trading to Canadian points. We are entirely at one with the Newcastle shipowner when he remarks that it is incredible that these suggestions could for one moment be entertained by any body of right-thinking men.

Railroad and Steamship Comparison.

"It would appear," he continues, "there does not exist in Ottawa a sufficiently clear conception as to the economic difference between a railway and an ocean-going steamship line." True, and a similar lack of comprehension is to be found in many other quarters; yet the situation ought to be plain enough to any man gifted with a normal amount of reasoning power. Mr. Noble goes on to state the entire case in all its details. He points out that a railway company's capital has been mainly employed in preparing the ground and laying the track; that it cannot be removed from the district which it serves, and that accordingly it becomes, in a sense, a part of the country itself. When a railway company, he says, receives a charter to put its line through a certain district it obtains a monopoly, and it thus becomes incumbent upon the Government to see that that monopoly is not abused.

A steamship company, on the other hand—we are summarising Mr. Noble's remarks—has, in reality, no monopoly at all. A competitive line may at any time be established. Moreover, "with very few exceptions, steamship rates are regulated by the laws of supply and demand—that is to say, should a line or number of lines in conference together agree on a rate altogether out of proportion to the value of the goods, it would be impossible for any traffic to move, and, automatically, the rate in question would cease to exist for all practical purposes. The result would be that a fresh rate, which would give a just and proper share of the profits of the transaction to both parties interested, would come eventually into existence." There is, of course, nothing very new in these arguments, but they are so convincing as to bear repetition.

The State Service Idea.

With regard to the idea of a State service, one may safely put this suggestion aside as utterly futile and silly. Neither the Dominion Government nor our own is likely to embark on such a proposition. It is becoming quite the fashion nowadays for traders who cannot make their own terms for the sea-carriage of their goods to cry out loudly for a State-owned line of steamers, but whether they expect the cry to be responded to is another question. The absurdity of the demand becomes apparent enough when one follows it out to its logical conclusion. If a Government is to come to the rescue of distressed shippers by providing a line of its own, it ought naturally to extend a similar helping hand to everyone else who claims that he is being overcharged. When the price of bacon becomes so high that the householder shudders at the sight of that commodity, the State ought at once to set up in the bacon-curing industry. When butchers' meat becomes so dear that Mr. Lamb's weekly bill is a thing of terror, the State ought to open butchers' shops all over the country. This, at least, is the natural sequence to the merchants' and shippers' demand for State steamship lines. —Syren & Shipping.

LARGE CAPACITY LOCOMOTIVE BOILERS.

THE necessity for providing a boiler of large capacity in the locomotives employed in heavy main-line service is becoming increasingly apparent, states the Railway Gazette, and the ratio between boiler capacity and cylinder volume, although of the first importance when designing a locomotive, is not necessarily the determining factor when settling the dimensions which the boiler and fire-box shall have. In order that there may at all times be a sufficiency of steam for all probable requirements, it is desirable that the boiler should be of such a size as to allow of sufficient space in which to generate steam to be held in storage or reserve for any emergency call that is likely to be made upon it.

This is the basis of at least one successful locomotive design employed on one of the railways running north of London, England, the engines having comparatively small cylinders, but very large boilers and ample heating surfaces and grate area. These locomotives are never known to run short of steam, but it was necessary, in order to give them these large capacity boilers, to utilize the 4—4—2 wheel arrangement in place of the 4—4—0.

The opinion has been expressed that, under the increasingly arduous conditions which locomotives on British main lines are now being called upon to face, the 4—4—0 wheel arrangement hardly lends itself favorably to the development of boiler design, except where super-heated steam is employed, and there would seem, concluded our contemporary, to be very good ground for holding this opinion.

CINDER CONCRETE.

By W. L. C.

WITH every succeeding year, the utilization of reinforced concrete for building purposes of every sort is becoming more and more general. Both from experience with actual constructions and through the employment of tests, engineers are able to foretell how the various forms of the material will act under different conditions. Moreover, in the field of fireproof construction of buildings, concrete stands pre-eminent, with regard to durability, economy, and fire-resisting qualities. Many interesting facts have been brought to light with regard to the manner in which concrete withstands fire, and the investigations along these lines have been thorough and far-reaching.

Fireproof Floors.

The use of cinder-concrete in fireproof floor construction has been growing in popularity from day to day. Objections to the use of this material have been advanced, in view of the fact that in some cases where it has been used, piping for the sprinkler systems or for other purposes has been corroded to such an extent as to be rendered useless. For this corrosion the cinder-concrete has been blamed. However, it has been demonstrated that, if the cinders are not new, are free from sulphides, and that if the mixture consists of one part of cement to ten parts of cinders, with enough sand to make a dense mixture, there is little or no danger of the corrosion of water piping.

A recent fire, water and load test, carried out upon cinder, terra-cotta and gypsum floor arches, showed that the first-mentioned material was the best of the three. A fire was kept burning continuously below the floor for a period of four hours, and during that time the floor was subjected to an average temperature of 1700 degs. F. At the end of the four hours, a fire stream was turned on the roof, while it was still red hot. The floor load during the test was 150 pounds per sq. ft.

The cinder-concrete suffered very little damage, and the test served to furnish an additional proof that this material is an excellent fire-resisting medium.

REDUCE OR ABOLISH DUTIES ON MACHINERY.

MR. BEN. MORGAN, discussing the all-important question of Canadian freight rates in The Financial News, London, England, on October 1, declares that the Dominion Government has the remedy in its own hands. One solution, he maintains, could be found in the reduction or abolition of the existing Canadian duties on British machinery, steel and iron girders, and heavy goods of that class.

Such a concession to the Motherland need not affect more than six to eight items in the Canadian tariff, but it would undoubtedly attract a considerable volume of British goods to Canadian ports, and assure a considerable freightage in the direction of Canada.

Assuming that the British consigner paid three dollars per ton on this freight, says Morgan, the return freight would be very much lower, and would be all in favor of the Canadian producer. The effect of the assuring of a given volume of freight towards cheapening the return freight is one of the commonplaces of shipping practice. Great Britain does a larger trade in exactly this class of goods with Argentine, and takes in return, year by year, a very considerable amount of River Plate wheat.

MOTOR SPIRIT FROM PEAT.

PEAT may now come to the front as a commercial source of motor spirit, as it has at least been found practicable to get rid of the water by mechanical pressure. The basic principle of the press is its sub-division into a series of concentric chambers with porous double walls of metallic gauze, through which the excluded water can escape. The dried peat is then subjected to destructive distillation, yielding the usual range of by-products. The wettest peat bogs can be dredged and turned to account, as there is no occasion to confine operations to the surface or upper sections.

Recent Judicial Decisions

Toronto, Ont.—On the 24th of February last a steel beam attached to a travelling crane in the moulding shop of the Dodge Manufacturing Co. broke without warning, dropping a large iron clad box, weighing 1,650 pounds, upon Charles W. Randall, a moulder employed in the shop. He died shortly afterwards in the Western Hospital.

An action brought on behalf of the widow and infant children has just been settled, the company paying a total of $1,800, besides a certain contribution towards the costs. Notice of trial had been given for the present Jury Sittings. The settlement was approved of by Mr. Justice Middleton in a judgment which orders $1,300 to be paid into Court, to be paid out at the rate of $180 a year, principal and interest combined, for the support of the widow and her two infant children, a boy aged eight and a girl aged six. The balance of $500 is to be distributed by Mr. N. F. Davidson, K.C., in payment of the debts and assisting the widow in paying off a mortgage on her home, 569 Clinton street.

The application of the moneys is an example of the tendency of the Courts to use such moneys as if they were the continued earnings of the workman, instead of setting aside any fixed proportion to be paid to the children when when they come of age.

No satisfactory explanation of the breaking of this beam, which had for ten years carried double and treble the load at the time of the accident, was discovered, notwithstanding a very searching inquiry at the inquest and during the progress of the litigation.

Montreal, Que.—Because a manufacturing concern left a projecting screw on a pulley unprotected, a jury in the local courts recently decided that the company was responsible for an accident which befell a workman, and accordingly condemned them to pay $3,000. Incidentally, to arrive at such a decision, the jurymen passed an opinion on a point of rather more than ordinary interest to manufacturers and others who happen to be interested in the conducting of factories where a number of workmen are engaged. They declared that the Company which owned the machinery in the factory and which, therefore, had the repairing power over such machinery, had such machinery in its care, and this despite the fact that the machines in question were operated under the direct supervision of a contractor who, as head of a department, engaged his own men to operate the machines, paid the men out of his own pocket, and had full charge of the men—of whom the victim of the accident was one. The point will be discussed before a higher court, however, judging by intimations thrown out after the verdict, by the counsel who appeared on behalf of the defendant Company. Judgment in accordance with the verdict has not as yet been handed down by Mr. Justice Guerin, his Lordship postponing such decision until later, when opposing counsel will again appear before the court. It is the desire of the defendants that the law point involved form the subject of further judicial pronouncement, and, to this end, a motion was made that the matter be referred to the Court of Review. It is not unlikely that the case will be brought to the attention of this latter tribunal, and afterwards to the attention of other appellate courts, as it is realized that the matter is one of vital interest to practically all engaged in the manufacturing business. The suit was that of Desparoi vs. Frothingham & Workman, the hearing before the jury having taken up no less than six days. Plaintiff claimed $10,000 damages on account of injuries sustained by his son, a minor, whilst in the employ of one Nantel, a contractor, head of department, who conducted operations in one of the departments of defendant's factory. The boy was badly injured by being caught in a quickly revolving pulley which had a set screw projecting from it. Suit was entered against Nantel under the Workmen's Compensation Act, and against Frothingham & Workman under the common law. In the case of the latter the plaintiff contended that as the firm owned the premises where the boy was at work, as well as the machinery, which was responsible for the mishap, and as the firm had alone the repairing power over such machinery, it alone was to blame because such machinery was defective. The mere existence of such a defect, argued plaintiff, pre-supposed negligence or fault on the part of the firm—such fault or negligence being quite distinct from that (if any), of which the actual employer of the lad might be guilty. The jury fell in with this view. Hence the verdict, as above stated.

* * *

Fort William, Ont.—Negotiations for the sale of C.P.R. elevators "A" and "C" to the James Richardson Co. were reported on October 3. The elevators have a capacity of 1,100,000 bushels, and are situated on the Kaministiquia River. It is said that the Company is not willing to sell the land, but will give a lease of it for a long term.

MACHINERY HALL, CANADIAN NATIONAL EHIBITION.

On the subject of the Machinery Hall at the Canadian National Exhibition, held annually in Toronto during the last week of August and the first week of September, the William Hamilton Co., Ltd., Peterborough, Ont., write as follows:

We have your recent favor in reference to the present Machinery Hall at the Canadian National Exhibition. There is no question that manufacturers of heavy machinery who wish to exhibit at the Canadian National Exhibition are under quite a handicap with the present building, as no appliances are there for handling heavy machinery. The building was evidently never built originally for the display of heavy machinery, and it is impossible at the present time to build anything like a permanent exhibit, and, therefore, machinery cannot be shown to very good advantage.

Our own opinion of the matter is that a new Machinery Hall is necessary, and we think that the proper way to build it is on the general lines of a modern, up-to-date machine shop, having an electrical travelling crane running the full length over the centre, in which heavy machinery can be exhibited, and which could be handled and put into place with this travelling crane. The sides could be made in the form of bays, where the lighter machinery could be shown, and no doubt either travelling jib cranes or portable derricks could be used to put this machinery in place. As it is, there is no place now even to hang a chain block, and some equipment for handling machinery is absolutely necessary.

FLOATING DRYDOCK TOLLS.

An Order-in-Council has been passed approving the schedule of tolls to be charged by the Canadian Vickers Co. for ships entering their floating drydock, the Duke of Connaught, at Montreal. The tolls, which are exclusive of charges for repairs, are graduated according to the gross tonnage of the ships, the minimum being $300 dollars for the first day, and $80 for each subsequent day on tonnage up to $1,000.

The maximum is based on a tonnage of 25,000, the entrance charge being $2,750, and the subsequent daily rate, $1,250. Among the regulations, one provides that vessels of his Majesty's navy and vessels in distress involving risk of foundering, shall at all times have priority of docking over all vessels registered in the entry book.

CIRCULATION OF "PANIC" REPORTS.

DURING the past week, reports have been circulating in Canadian industrial spheres to the effect that our leading steel and ironworks, carbuilding plants, etc., were on the verge of closing-down through lack of orders on hand. One redeeming feature of the attempt to precipitate a panic in our basic industries, however, was the fact that much of the reports contents were so extreme and of necessity so evidently faked, that, generally speaking, little harm was done or excitement caused. In addition, prompt official denial was forthcoming by those responsible for the industrial undertakings concerned.

While it is true that there are a greater or lesser number of people always ready to throw up their hands when a dipping tendency appears in the natural course of business enterprises generally, it remains to be recorded that there are those in our midst, and comparatively insignificant numerically, who are out for personal gain, irrespective of cost or consequences to those others who constitute the sinew and backbone of our country. The unfortunate thing about the dissemination of panic news, is the fact that it is extremely difficult to trace the culprits to their lair. This class of individual is a menace to the development and growth of this Canada of ours in its every feature, and it is up to our manufacturers and our Captains of Industry—the men who are building up our Nation, to make it known that they not only dis-associate themselves from the panicmonger, but that they will take every legitimate means of combating his despicable work.

Business in our manufacturing enterprises, as in every other sphere of our complex being and relationship will fluctuate, yet, we can train ourselves to take the fall as well as the rise, calmly and preparedly, and with the panic part eliminated, all of us are generally the better for the backward swing of the pendulum.

VICTIMS OF CIRCUMSTANCE.

ONE of the Pilkington Brothers, the well-known British manufacturers of glass who are building a large branch plant at Thorold, Ont., was standing watching building operations the other day, at the same time talking of how the plant came to Thorold, and how other cities missed this big industry. He was referring to a nearby city, which we will call Peachville, and said that but for certain circumstances, the glass factory of Pilkington's, Ltd., would now be building in Peachville. The fact is that when Pilkingtons were looking for land in the Niagara Peninsula, they called at Peachville, but found the industrial commissioner away. Later they ran across this farm at Thorold, which they purchased, and never gave Peachville further thought.

This is no discredit to the industrial commissioner of Peachville, for had he known, he would have striven for it, tooth and nail. The claims of his city were such as could not be passed over as they were by the Pilkingtons, but it shows what trivial circumstances control the gaining and losing of big industries.

GOOD BREEDING VS. ZEAL.

IN these days of extreme competition and slack trade a salesman must be very zealous indeed to land good business. He should never let his zeal override his etiquette. We heard a story this week of a steel salesman who secured a big order from an Ontario manufacturer. The story really concerns two salesmen, but one through too much zeal lost the order. There are three personalities in the case, the third being that of the manufacturer who, because he detested bad breeding, favored the salesman who did not carry his zeal too far. In brief the story is thus: the manufacturer told salesman No. 1 to see him the following afternoon as No. 2 was coming in the morning, then he could compare their prices. No. 1 came in the morning and his visit coincided with that of No. 2. He lost his order by being over zealous.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Oct. 6, 1913.—Though money is circulating more freely and general manufacturing conditions continue to show a slight improvement, business among the large machinery houses is still very quiet; moreover, there does not seem to be any immediate prospect of better times. Orders for the equipment of the Atlantic Sugar Refineries have not yet been placed, and there is no other important prospect in sight at the present moment.

A sensational report was published last week in a Montreal evening paper to the effect that the Canadian Car and Foundries Co. would be compelled to close down all their plants by Christmas owing to lack of orders. The firm in question at once denied the truth of the report, yet admitting that this winter would probably find them less busy than usual. However, orders at present on the books ensure practically full activity up to the end of the year at any rate. There seems to be a general feeling that the various car building companies have a period of dulness ahead of them; but there is really little ground for the belief. With the ever increasing mileage of our railways, the demand for cars of every type is bound to be a steady one. The Railway Companies at this time do not usually send in many orders, as it is later in the year that their rolling stock is overhauled and new orders placed. However, the late money tightness will doubtless have its effect in lessened orders in the immediate future, not only among the car builders, but also with the locomotive works.

A meeting of the bond holders of the Canada Iron Corporation has been called for October 18th, when a scheme for starting up the foundries again will probably be submitted. It is understood that all the foundries were being operated at a profit at the time of the liquidation, and it is probable that a short time now will see them in full blast again. The blast furnaces at Midland, Ont., however, were run at a loss, and are not likely to be blown in again for some considerable time.

Pig Iron, etc.

An active demand for winter supplies of English pig continued all last week, several orders of considerable size having been booked. Prices remain firm at last week's figures. Copper remains dull in local circles, with a poor demand. The price made a sensational jump to £74 10s per ton in London last week, but rapidly dropped back again later to its former level. The present state of the market is puzzling speculators considerably. Lead is a shade firmer this week, but spot supplies remain very scarce. Tin is down to $42.50, but this is probably only a temporary set-back.

Toronto, Ont., Oct. 6, 1913.—For some time at least, the United States tariff bill which became law last week, will not affect the steel business much in Canada. Some provisions will touch it more than others, and will be felt in different parts of the Dominion. The metal business will see results quicker and bigger than the steel trade. One of the largest metal houses in Toronto stated to-day that they expected to double their business in a short time. Manufacturers who are buying steel just now, with one or two exceptions, are not showing any concern over the new tariff bill. There appears to be plenty of confidence on this side in the Democratic administration; nevertheless, underneath, there is a fear that something might happen.

There are few changes in the steel tariff. The following principal items are now on the free list: Farm implements, cash registers, hoop or band steel cut to lengths, iron ore, manganese, cut nails and cut spikes, railway bars, steel ingots, blooms and slabs, and all barbed wire. Other important products placed on the free list are:—Brass clippings, old brass, Cobalt, copper ore, coal (anthracite and bituminous), junk of all kinds, and tin ore.

Cheaper Steel.

Warehouse steel prices in Toronto are down five cents a pound, due to much quicker mill deliveries. Whereas, in the spring, plates were offered from the mills in three to four months, they can now be secured in from six to eight weeks. In the case of structural steel there is not much difference. The time for receiving steel bars from the mills has shortened from 3-4 months to 1-2 months. These conditions may not last long, however, owing to the large tonnage being booked just now. Local business has been much livelier during the last few weeks. Implement men who did not buy a pound of steel a month ago, are now beginning to make plans, believing that the western farmer will be ready to buy again by the spring.

Machine Tools.

It was stated last week that the order for machine tools to be used in the new plant of the Abitibi Pulp and Paper Co., at Iroquois Falls, Ont., had not been definitely awarded. It is now known that the machine tools have been ordered through Williams and Wilson, Montreal. In the country there are a few scattered orders for tools. Orders have been placed in the city this week for several large lathes and milling machines. The Canadian Copper Co., Copper Cliff, Ont., near Sudbury, have called for specifications for tools to supply their new machine shops, boiler shop, blacksmith shop, and carpenter shop. The list of tools required includes lathes, bolt cutters, several drills, two shears, and steam hammer. For the carpenter shop, there are required saws, planers, moulder, boring machine and surfacer.

Metals.

Among the things allowed to enter the United States free under the new tariff bill is junk of all kinds. This will be good news for Canadian metal concerns. The duty on several virgin metals has also been reduced. Frankel Brothers expect to double their business as a result of the tariff changes. Otherwise, there is nothing to report.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Woodstock, Ont.—The Board of Trade sent a deputation to Indiana last week to meet the directors of an iron industry, who are thinking of locating here.

North Battleford, Sask.—W. A. Brown of the Canadian Northern Railway announces that the round house and repair shops here will be increased in size.

Prescott, Ont.—The Dominion Government has purchased a site here for a factory, in which they will manufacture lighthouse apparatus, including fog alarm machinery and structural steel towers.

Ottawa, Ont.—Work on the new C.N.R. shops, which are being erected at Rideau Junction, is progressing. The foundations are now laid, and the buildings will probably be finished early next spring.

Weyburn, Sask.—The Dominion Odic Electric Co., capitalized at $1,000,000, have taken over the Weyburn Foundry and engaged E. J. Lewis as manager. They will install a plant for the manufacture of electrical machinery. Dr. E. M. Gratopp, president.

Exeter, Ont.—An application to the ratepayers for permission to lend $10,000 to the Exeter Mfg. Co., Ltd., will be made on October 18. This company, which is composed of The J. B. Foote Foundry Co., The F. B. Zieg Mfg. Co., and F. B. Zieg, all of Frederickton, Ohio, will acquire the foundry of James Murray & Son, and will establish a plant in Exeter for the manufacture of road-making machinery, cast iron pipe.

Thorold, Ont.—Seventeen carloads of supplies have arrived at Thorold for work on No. 3 section of the Welland Canal. Fifteen dump carts, a steam shovel, an upright engine, along with a No. 3 dinkey and a large amount of timber are also on hand. A switch is being laid from the Welland station yards in order to unload the supplies. O'Brien & Doughney will erect an office, a machine shop and other buildings on the Campbell estate.

Gananoque, Ont.—Damage estimated at $50,000 resulted from a fire which gutted one of the spring factories belonging to the Spring & Axle Co. here on October 1. The loss is fully covered by insurance, placed through Irish and Moulson, of Toronto. Preparations for rebuilding the structure will commence at once. The manager, Mr. Simpson, expects to be operating the plant again at its full capacity within a month. The axle factory adjoining the burned building escaped.

Sault Ste. Marie, Ont.—The Lake Superior Corporation have started work on the construction of a roasting plant for the treatment of siderite ore from their properties in the Michipicoten district. The new plant is being installed on the Company's brick plant property in Steelton, and on the line of the Algoma Central Railway. President Taylor says the cost of the new plant will run up to about forty thousand dollars. About fifty men will be employed on construction.

Hamilton, Ont.—The Hamilton By-product Coke Ovens, Limited, will locate in Hamilton. The plant will be built in units. The first unit will be built on a 33-acre site on the bay shore in the east end, and will consist of fifty ovens, each of sixteen tons capacity, operating on eighteen hours' coking time. A 5,000,000 cubic feet gas-holder will also be erected there. The plant will use 1,000 tons of coal per day, producing 700 tons of coke. Over one hundred men will be given employment at the start. United States capital holds a controlling interest.

Electrical

South Vancouver, B.C. — The city council will go ahead with the building of a civic power plant.

Smith's Falls, Ont.—The Smith's Falls Electric Power Co. have installed a 400 h.p. generator, which will more than double their lighting capacity.

Alberni, B.C. — The Ritchie-Agnew Power Co. will instal equipment of 250 h.p. capacity, costing $75,000 at Stamp Falls, and later will add a plant of 25,000 h.p. capacity, costing $2,000,000. This is contingent on the town of Alberni agreeing to buy power for 30 years at a little over 2 cents per k.w.h.

Municipal

Port Coquitlam, B.C.—The city will spend $15,000 on fire protection.

St. Mary's, Ont.—A by-law to guarantee bonds of $50,000 of the St. Mary's Flour Mills has been defeated. A 60-barrel mill was to have been erected.

Coldwater, B.C.—George Champe, Toledo, O., civil engineer, has been engaged to prepare plans and estimates of cost for installing a municipal waterworks plant for the village.

Calgary, Alta.—The stock yards by-law, authorizing the issuance of $350,000 in bonds; the industrial housing by-law, providing for the construction of a building for infant industries to cost $250,000, and a by-law providing for the building of a $30,000 tuberculosis hospital, were approved by the ratepayers.

Railways—Bridges

Ottawa, Ont.—The C.N.R. has laid the last rail of its route between Ottawa and Toronto.

Brantford, Ont.—W. P. Kellett states that the Lake Erie and Northern Railway will be in operation between Brantford and Galt about the middle of December.

Montreal, Que.—The Montreal and Southern Counties Railway Co. will open a new stretch of road from Richelieu to Marieville this week, and are pushing the line from Marieville to St. Cesaire.

Montreal, Que.—The Canadian Pacific Railway Co. has had constructed by the American Car & Foundry Co. two cars especially equipped for fire fighting. Each car carries a tank of 8,428 Imperial gallons capacity, and on the end of each there is a 7 x 10 x 10-inch duplex fire pump.

Toronto, Ont.—The Toronto Suburban Railway must proceed at once with the construction of the Pacific Avenue extension. If the City of Toronto is ready in time with the grading of Annette Street, that line must be proceeded with too. This in effect was the decision of the Ontario Railway and Municipal Board in disposing of the pleadings of the Toronto Suburban Railway to be relieved of the work of making the extensions at the present time.

To Complete Alberta Railway.—Premier Sifton announced to the Albertan Legislature on September 22 a final settlement of the Alberta and Great

Waterways Railway case, satisfactory to the Government, the representatives of the Royal Bank, the bondholders, and others interested. J. D. McArthur and his associates, owners of the Edmonton, Dunvegan & British Columbia Railway which is now being completed to Peace River, who also built a large section of the Grand Trunk Pacific, and are now building the Hudson's Bay Railway for the Federal Government, take over the charter, complete the road, and assume all existing liabilities.

Wood-Working

Wyoming, Ont.—Daniel Senecal will start to erect a box and basket factory next week.

Rossland, B.C.—J. S. Deschamp's planing mill was destroyed in a storm on Sept. 22.

St. Catharines, Ont.— The Northern Veneer Co. is erecting a veneer plant here, and expects to have a basket factory in operation by Dec. 1. Mr. Dalton, Grimsby, Ont., is president.

Chesley, Ont.—The Chesley planing mill, owned by Lueck Bros. & Elliott, was gutted by fire on Sept. 29. A quantity of valuable machinery was destroyed. The mill has been closed since last spring.

Ottawa, Ont.— Conveying machinery will be required to replace the sawdust conveyor destroyed by fire at the plant of the J. R. Booth Co., Ottawa. A new timber mill will also be built and equipment for it purchased.

Vancouver, B.C.—The Vancouver Industrial Sites, Ltd., have bought out the real estate holdings of the Imperial Car & Drydock Co., and have purchased a site for $200,000, on which they will erect dry kilns and an additional saw mill.

Marine

Welland, Ont.—Chief Engineer Weller, of the new Welland ship canal, has received word from the Dominion Dredging Co., who have the contract for building the new harbor, breakwater and pier at the canal entrance, Lake Ontario end, that they are bringing their entire fleet of dredges down the lake and will make an early start on the work.

Four more sections will be under contract this year, being Nos. 2, 5, 7 and 8. One will be the section including the large lock north of Port Colborne. The section north of Welland, which requires the removal of the aqueduct and raising the Welland River level will not be let this year.

General Industrial

Wadena, Sask.—The Fibre Co. have appointed directors, and will build a flax mill here.

Listowel, Ont.—The plant of the Maple Leaf Portland Cement Co. of Atwood, Ont., has been closed for the winter.

Vancouver, B.C.—W. Hales Turner, High Elms, Lennox Road, Gravesend, England, is contemplating the establishment of a plate porcelain factory, costing $150,000, in Vancouver.

Rosthern, Sask.—Work has been started at Duck Lake upon the erection of a 75 barrel flour mill by the Duck Lake Milling Co., which is capitalized at $40,000. The building will be 48 x 78 feet. two stories high. The president is Hillyard Mitchell, Duck Lake.

Brampton, Ont.—Builders will start work at an early date on a new paper mill in Brampton. Barber & Colbert is the name of the new firm who plan to erect a two-storey building. Mr. Barber is a son of John R. Barber, a well-known paper manufacturer of Georgetown, and Mr. Colbert is former superintendent of the old Barber mills.

Contracts Awarded

Winnipeg, Man.—The Vulcan Iron Works has been awarded the contract for the steel work on the new $50,000 building for the Adanac Club.

Toronto, Ont.—The contract for the erection of a new isolation hospital for York County at Newmarket, Ont., has been awarded to W. B. Graham, Toronto.

Montreal, Que.—A. F. Byers & Co., of 340 University Avenue, Montreal, are general contractors for the new pattern shop which the National Bridge Co. is having built.

Lindsay, Ont.—The contract for building the Mud Lake Narrows bridge was awarded to the firm of Coates & Jupp, Orillia. The structure is an all concrete one, and will cost about $3,000.

Elko, B.C.—The Elko Water, Light & Power Co. have awarded a contract for the piping of water from Silver Spring Lake for Elko waterworks. An initial outlay of $22,000 is contemplated.

Welland, Ont.—The contract for the construction of the Union Carbide Co.'s plant has been awarded to the Lackawana Bridge Co. of Buffalo. The plant when completed will cost a million dollars.

Welland, Ont.—Clark & Sons, contractors, of Toronto, have secured the contract for rebuilding the Welland Court House, which was damaged by fire June 11, and have started work. The contract price is $16,000.

Welland, Ont.—The contract for the lighting and the power used on the Welland Canal has been given again to the Lincoln Light and Power Co., by the Dominion Government. The renewed contract is to run a number of years, at the same figure as before.

Montreal, Que.—Ross & McComb have been awarded the contract for the concrete sub-structure of a bridge over the Yamaska River at St. Cesaire for the Montreal & Southern Counties Railway. They also have the contract for building the line through Granby, Que.

Ottawa, Ont.—The Department of Marine and Fisheries has completed plans for the construction of the second largest ice-breaker in the world. The vessel is for use on the lower St. Lawrence. The cost is estimated at $750,000. The contract will be given to the British firm of Vickers Sons & Maxim.

Montreal.—The Dominion Bridge Co. has been awarded the steel for the crucible steel plant for the Armstrong Whitworth Co., Montreal. The Whiting Foundry Equipment Co., of Harvey, Ill., has been given the contract for five 5-ton cranes and one 15-ton crane, while the buildings, waterworks, and drainage contracts go to E. G. M. Cape, of Montreal.

Refrigeration

Saskatoon, Sask.—The Saskatchewan Abattoirs, Ltd., capitalized at $200,000, will shortly erect a plant.

Winnipeg, Man.—The Board of Control has awarded the contract for the construction of a refrigeration plant, to cost about $12,000.

Lethbridge, Alta.—The United Farmers of Alberta are interested in a proposition to erect a co-operative pork packing plant to handle 50,000 hogs annually. Secretary, P. P. Woodbridge.

The York Manufacturing Co., York, Pa., makers of ice-making and refrigerating machinery, have recently supplied the following equipment: Manitoba Agricultural College, Fort Garry, Man., one 4-ton vertical single-acting belt-driven enclosed type refrigerating machine and high pressure side complete. Joseph Kilgour, Toronto, Ont., one 4-ton vertical single-acting belt-driven enclosed type refrigerating machine and high pressure side complete.

Ottawa Dairy Co., Ottawa, 3,615 feet of 1¼ in. direct expansion piping for bunker coils.

Tenders

Cambie, Richmond, B.C.—Tenders will soon be called by the municipality for the construction of an emergency water main across the Lulu-Sea Island Bridge.

Montreal, Que.—Tenders have been called by the Montreal & Southern Counties Railway for a new sub-power house at Rougement, Que., and for extensive rolling stock.

Regina, Sask.—Tenders will be received until Oct. 25 for the supply of one 3,000-kilowatt steam turbine with condenser and one hand power crane for 45-foot span. Specifications may be obtained from E. W. Bull, superintendent of the light and power department.

Port Arthur, Ont.—Tenders are now being received for the construction of the plants of the Canadian Conley Frog and Switch Co. The plant will be completed by May, 1914. G. R. Duncan, Port Arthur, are constructing the foundations. The Conley headquarters are in Memphis, Tenn.

Winnipeg, Man.—Tenders addressed to the Chairman, Board of Control, will be received at the Office of the undersigned up to October 16th, for the manufacture, delivery, installation and testing, in the Grand Trunk Pacific shops at Transcona of transformers and switching apparatus complete as per specification. M. Peterson, secretary.

Toronto, Ont.—Tenders will be received by registered post only, addressed to the chairman of the Board of Control, up to Tuesday, October 21, for 20-inch cast iron pipe, 36-inch cast iron pipe, 36-inch and 20-inch stop valves, and 36-inch and 20-inch cast iron special castings. Specifications and tender form for the foregoing may be obtained upon application at Room No. 9, Department of Works, City Hall, Toronto.

Trade Gossip

The Studebaker Sales Agency, Ltd., has changed its name to the York Motors, Ltd.

The Tweed Electric Light & Power Co., Ltd., has reduced its capital from $40,000 to $24,000.

The E. B. Eddy Co., of Hull, Que., have recently installed a 30-ton crane of 50-ft. span, for raising gates at the new power house. This was supplied by the International Marine Signal Co., Ottawa.

Transformer Order. — The Hydro-Electric Power Commission of Ontario have placed an order with the Canadian General Electric Co., Limited, for six transformers, each 3,500 k.w., 46,000-2,300 volts.

Electric Motor Contract.—The Donnacona Paper Co. of Donnacona, Que., has ordered electric motors ranging from 150 h.p. downwards, and aggregating 1,330 h.p. from the Canadian General Electric Co.

Thrifty Mechanics.—A Chatham, Ont. mechanic purchased $1,500 worth of Chatham debentures last week. The "Chatham News" asks why other people do not act so wisely. Other people don't have so much money.

Motor Order.—The Abitibi Pulp and Paper Co. has placed with the Canadian General Electric Co. an order for electric motors, ranging from 400 h.p. downwards, and aggregating 2,165 h.p. for their new mills at Iroquois Falls, Ont.

The Aluminium Castings Co., Ottawa, Ont., have installed 6 more furnaces, bringing the plant capacity up to 2,000 pounds per day. A 5-ton crane, supplied by the International Marine Signal Co., Ottawa, has been installed in the foundry.

New Hospital for Steel Company. — Excavations for the foundation of the new emergency hospital for the Dominion Iron & Steel Co., at Sydney, N.S., are under way, and the building will be rushed to completion before cold weather sets in.

The Toronto Electric Light Co. have recently purchased 2,200 h.p. of Riley Self-Dumping Underfeed Stokers, to be used in a stand-by steam station as a reserve for the power from Niagara Falls. The above type stoker was described and illustrated in the April, 1913 issue of our journal, The Power House.

F. Reddaway & Co., Newark, N.J., have appointed The A. R. Williams Machinery Co. to act as exclusive selling agents for the "Camel Hair" belting in Toronto and West to the Pacific Coast, also that complete stocks of "Camel Hair" belting are now being carried by the A. R. Williams Co. in Toronto, Winnipeg and Vancouver.

Morrisburg, Ont.—From the judgment of Hon. Mr. Justice Hodgins, Judge in Admiralty of the Exchequer Court, Toronto district, an appeal is to be made to the Supreme Court of Canada in connection with the barge Huron, which was wrecked here and its cargo destroyed in August of last year. Judge Hodgins gave judgment for $22,387 with costs in favor of the Montreal Transportation Co.

J. H. Williams & Co., Brooklyn, N.Y., advise us that they have not purchased a site or yet considered the establishment of a plant in St. Catharines, Ont. The item concerning the St. Catharines plant was evidently intended by our correspondent to refer to the branch factory being erected by the Williams Co., at Buffalo, N.Y.

C.N.R. Tunnel Electrification.—The Canadian Northern Railway Co. has just placed with the Canadian General Electric Co., Ltd., an order for the complete electrification of its tunnel under Mount Royal and of its terminals on Dorchester Street in Montreal. The contract, which amounts to about $500,000, includes seven locomotives, multiple unit cars, generators, switchboards and other auxiliary apparatus.

Boiler Inspection Certificates. — A number of boiler manufacturers, etc., attended the Parliament buildings last week with the hope of eliciting the opinion of the Ontario Government in regard to reciprocity of boiler inspection certificates between the various provinces. They declared that much needless trouble and expense is incurred under the present conditions, and that one provincial inspection should meet the demands of all concerned in the business. Other Provincial Governments will be approached in the near future.

Electric Pumping Plant.—The Canadian Collieries (Dunsmuir) have decided to instal an extensive electrically driven pumping plant. There will be four separate units. Two will be driven by 75 h.p. a.c. motors and a third by a 75 d.c. motor, each unit being capable of delivering 350 gallons per minute against a head of 370 feet. The fourth unit, consisting of two pumps working in series, will deliver 350 gallons per minute against a head of 740 feet. The pumps will be built by the Canadian Allis-Chalmers, Ltd., and the motors by Canadian General Electric Co.

High Factory Taxation.—After further consideration of the appeal of the Massey-Harris Co. against the city's assessment of $609,000 on the Company's factory site on King Street West, Toronto, the Court of Revision decided to make a reduction on the whole 26 acres of $18,525, making the total figure $590,475, which compares with an assessment of $300,000 two years ago. The reduction was made on parcels of land used by the Company for the purpose of storing lumber. Mr. P. H. Drayton, chairman of the court, intimated that he was in favor of lower assessments on factory sites in the city of Toronto. "I do not believe in taxing the manufacturers until they are compelled to move outside the city," he said.

Brantford, Ont.—That Brantford will be able to meet the competition of other Ontario cities in securing Canadian branches of United States factories is now assured. At a meeting held under the auspices of the Greater Brantford Association, which was attended by about sixty citizens, representing practically all branches entering into the building of factories, promises of co-operation and concessions were made by brick manufacturers, cement manufacturers, gravel and sand pit owners, the Brantford Roofing Co., architects and real estate owners in the city, tending to greatly reduce the cost of factory sites, and cutting off about 20 per cent. of the cost of building factories here. It was announced that the promise had been made of twenty acres free for factory sites, while other plots had been offered at 50 per cent. of their value or less.

The Bury Compressor Co., Erie, Pa., manufacturers of the Bury three-cylinder variable compressor, as well as compressors to meet all engineering requirements, and who are represented by the A. R. Williams Machinery Co., Toronto, Ont., are extending their main plant to accommodate increased business. Recent shipments to Canadian customers through the The A. R. Williams Co., include a three-cylinder variable volume compressor going into the mining district, consigned to the North American Smelting Co., Sydenham, Ont.; a duplex compound variable volume compressor to the Standard Steel Construction Co., Port Robinson, Ont.; a large compound air and steam machine to the Toronto Structural Steel Co., Toronto; and an 800 cubic ft. compressor for the Canadian Glass Co., Montreal, Que.

Water-Works

Galt, Ont.—The new dam of the Galt Gas & Light Co. across the Grand River was completed last week.

Montreal, P.Q.—Montreal's new $3,000,000 filtration plant is not large enough, and within twelve months at the latest another $1,000,000 or more will have to be spent on the work in order that it may meet the requirements of the city.

New Incorporations

Schroeder Mills and Timber Co., incorporated at Toronto, Ont., capital not to exceed $40,000, to manufacture timber, etc., in Ontario.

Dominion Reduction Co. Ltd., incorporated at Toronto, capital $2,000,000, to reduce ores, etc., at Cobalt. Incorporators: James G. Shaw, Joseph Montgomery, etc., Toronto.

Major Automobile, Ltd., incorporated at Ottawa, capital $50,000, to manufacture automobiles, etc., at Montreal. Incorporators, George A. Major, Alexis Frappier, etc., Montreal.

Automatic Fire Detectors, Ltd., incorporated at Toronto, capital $100,000 to manufacture fire extinguishers, etc., at Toronto. Incorporators: John F. Long, Frank P. Long, etc., Toronto.

Ogden Electrical Mfg. Co., Ltd., incorporated at Ottawa, capital $100,000 to manufacture electrical appliances and instruments at Toronto. Incorporators: James F. Edger, James E. Maybee, etc., Toronto.

Reid-Easey Co. Ltd., incorporated at Toronto, capital $40,000, to carry on the business of a general foundry and machine shop,etc., at Oshawa. Incorporators: George Proctor, Alfred Smith, etc., Beaverton.

St. Francois Co., Ltd., incorporated at Ottawa, capital $100,000, to carry on the business of a constructing and contracting company, at Montreal. Incorporators: Victor Pelletier, Jean de la Toure Fondue, etc., Montreal.

Central Contracting Co., Ltd., incorporated at Toronto, capital $50,000, to carry on the business of a sawmiller, etc., at Fort William. Incorporators: Edward R. Wayland, Charles E. Smith, etc., Fort William.

Ottawa Car Mfg. Co., incorporated at Ottawa, capital $3,000,000, to carry on business as manufacturers of steam and electric cars., etc., at Ottawa. Incorporators: James F. Smellie, Thomas A. Burgess, etc., Ottawa.

T. Heal Woodworking Co., Ltd., incorporated at Toronto, capital $40,000, to carry on the business generally of a contractor, carpenter, etc., at Toronto. Incorporators: William J. Mitchell, William S. Thomas, etc., Toronto.

Worr Foundry Co., Ltd., incorporated at Toronto, capital $40,000, to carry on in all their branches the business of iron founders, foundrymen and machinists. Incorporators: Ernest V. McMillan, James Aitchison, etc., Toronto.

Canadian Carter Co., Ltd., incorporated at Ottawa, capital $150,000, to build, construct, erect, equip, railways, tramways, roadways, tunnels harbors, slips, shipping places, at Ottawa. Incorporators: John B. Carter, Charles A. Denneen, etc., Ottawa.

Economy Fuse & Mfg. Co., of Canada, Ltd., incorporated at Ottawa, capital $5,000, to manufacture all kinds of mechanical and electrical appliances at Montreal. Incorporators, Richmond W. Hart, Armand Chenier, etc., Toronto.

Upper St. Lawrence Power Co., Ltd., incorporated at Ottawa, capital $3,000,000, to purchase, lease and operate water powers, etc., with headquarters at Toronto. Incorporators: James S. Lovell, William Bain, etc., of Toronto.

Maxwells, Ltd., incorporated at Ottawa, capital $400,000, to buy, sell, manufacture, in whole or part, farm implements, engines and machinery of all kinds, at St. Marys, Ont. Incorporators: Sir George Gibbons, George S. Gibbons, etc., London.

North American Development & Construction Co., Ltd., incorporated at Ottawa, capital $100,000, to carry on the business of hydraulic and electrical engineers at Winnipeg. Incorporators, Standish R. G. Vereker, Hamsterley, William J. W. Bullock, Winnipeg.

Cadillac Motors., incorporated at Ottawa, capital $50,000, to manufacture or otherwise deal in conveyances and machinery of all kinds, and all materials used in the construction or operation thereof, at Montreal. Incorporators: Francis G. Bush, Herbert Wm. Jackson, etc., Montreal.

The Inter-Provincial Engineering and Contracting Co., Ltd., incorporated at Toronto, capital, $75,000, to carry on the business of public and private contractors and manufacturers of building materials of all kinds, at Toronto: Incorporators: John T. Jackson, Samuel Jackson, etc., Toronto.

Personal

Senator Nathaniel Curry was inspecting the Canadian Car & Foundry Co. plant in Fort William on Monday, Sept. 29.

Hon. Nathaniel Curry, President of the Canadian Car and Foundry Co., was in Amherst, N.S., last week, inspecting the Rhodes-Curry Car Works.

K. L. Aitken, formerly general manager of the Toronto Hydro-electric System, has returned from Europe, and will resume his practice as consulting engineer. Letters may be addressed meantime, in care of the Toronto Hydro-electric System, 226 Yonge St., Toronto.

Catalogues

The American Wood-Working Machinery Co., Rochester, N.Y., have sent us a catalogue describing the full line of machines which they manufacture. Each machine is illustrated together with a specification, floor space required, weights, etc. A complete telegraph code is included, also an index. This is the 9th edition, and the illustrations are very clear, as is the reading matter. Copies may be had by writing Wm. Garlock, Jun., Peterkin Bldg., Toronto.

The Canadian Allis-Chalmers, Ltd., Toronto, have sent us section (A) of a bulletin on the "Cochrane" separators, which are made by the Harrison Safety Boiler Works, Philadelphia, Pa. The separators described in this bulletin are designed for live steam and for various pressures. Each type and size are illustrated together with tables giving the principal dimensions. The benefits to be derived from installing separators are dealt with fully. Copies may be had by writing this company.

Comparative Tests of Belts With and Without Cling-Surface is the title of a bulletin written by Robert Thurston Kent, M.E., and published by the Cling-Surface Company, Buffalo, N.Y. The bulletin contains a description of a series of tests on belts, with "Cling-Surface" applied, conducted by Mr. Kent. The tests were of an exhaustive nature and much interesting data was obtained. Several curves were plotted, these being published in the bulletin. Copies may be obtained from A. Eugene Michel, 233 Broadway, New York City.

Notes on Electric Lifts is the title of a handsome catalogue which we have received from Smith, Major & Stevens, Northampton, Eng. A detailed description with illustrations is given of the principal features embodied in the design of the elevators made by this firm, a special feature being made of the automatic control elevator. The catalogue also contains some excellent photographs of buildings where these elevators have been installed. Gorman, Clancy & Grindley, Ltd., Edmonton, Alta, the Canadian representatives, will be pleased to mail copies on request.

"**The Lagonda Roller Bearing Cleaner**" is the title of Bulletin X, recently issued by the Lagonda Mfg. Co., of Springfield, Ohio. It describes a new type of water driven boiler tube cleaner which they have just perfected and put on the market. In this new cleaner, the old type thrust bearings have been replaced by tapered roller bearings. It is pointed out in the bulletin that experience and long service have proven that bearings of this type are admirably adapted for use on automobiles, where the bearings are subjected to severe thrusts, and as these are the conditions encountered in turbine tube cleaners the adoption of this bearing has resulted in a marked increase in efficiency and power output of the new type of cleaner. Copies of the bulletin may be had by addressing the company as above.

"**The Lagonda Air Cleaner,**" is the title of Bulletin Y, recently issued by the Lagonda Mfg. Co., of Springfield, Ohio. It describes a new type of air driven boiler tube cleaner which has several novel features. One is the use of an adjustable air admission port in the corner, by means of which the size of the air opening can be adjusted to exactly meet the air pressure conditions in any given plant, thus insuring that the cleaner develops the maximum amount of power for the quantity of air consumed under all conditions. The method of dismantling the cleaner is extremely novel. It is only necessary to loosen a hexagonal retaining ring at the front which renders all of the interior parts of the cleaner readily accessible without the use of tools. Copies of this bulletin may be had by addressing the Lagonda Mfg. Co. as above .

Everything in Sheet Metal.—A catalogue has recently come to our attention which embraces a more than usually complete line of sheet metal products. Every conceivable need of the varied types of building construction appears to be anticipated, and every imaginable building material is illustrated and thoroughly described, including roofing, siding, eaves trough, conductor pipe, gutters, ventilators, skylights, metal ceilings, metal furniture, metal lumber, metal stock room equipment, cornice, finials, reinforcing and furring plates, metal lath, metal shingles, tin plate, metal tile, etc. Everything is classified in so thorough a manner that it is immediately located, and many tables are given which will prove especially valuable to the sheet metal worker or to the prospective buyer of these materials. The Berger Mfg. Co. of Canton, Ohio, is the publisher of this book, and their line needs no introduction to the building fraternity. A copy of this book will be gladly sent to any of our readers interested.

◆

J. A. Fortier & Co., Ottawa, Ont., have been appointed agents for the Arctic Ice Machine Co., Canton, O. Messrs. Fortier are experts in refrigeration. This appointment has been made necessary owing to the exceptional number of inquiries received by The Arctic Ice Machine Co., from Canada of late.

Book Reviews

The Department of the Interior, Bureau of Mines branch, of the U. S. Government has published Technical paper No. 43, entitled "The influence of inert gases on inflammable gaseous mixtures." This bulletin contains the results of experiments, conducted by J. K. Clement on various gases present in coal mines.

The Department of the Interior, Bureau of Mness branch, of the U.S. Government has published bulletin No. 64, dealing with the titaniferous iron ores in the United States. This bulletin contains the results of investigations conducted by J. T. Lingewald, Jun., on the above subject together with a number of illustrations of different varieties of iron ore.

The City of Port Arthur, Ont., have issued two bulletins, one entitled the "Geneva of Canada," and the other "Camera Glimpses of Port Arthur." The former contains several half tones of scenery and pleasure resorts in the vicinity of the city, also views of the principal buildings and docks. The principal features of the city are described fully, with useful information for visitors. "The Camera Glimpses" contains a number of views along the same lines, together with brief descriptions.

"**Principles of Setting Out, Securing, and Tooling Operations,**" by Alfred Parr, instructor and lecturer on engineering workshop practice, University College, Nottingham, England; Longman and Co., London, New York, etc.; The Renouf Publishing Co., Montreal, publishers' agents for Canada. Price $2.25. A number of years ago we had the pleasure of reading a volume entitled "Machine Tools and Workshop Practice" by the same author, which came at a time when radical changes were being evolved in machine tools. This new treatise on "Principles of Setting Out," is even a better work than its predecessor. Some of the ground covered by the latter is covered again, but there is so much new matter on the subject of setting-out, and on new tools which have appeared since the author's last work was written, this can be excused.

Engineering as a Profession, by A. P. M. Fleming, M.I.E.E., and R. W. Bailey, Wh. Sc., cloth, 288 pages. Published by John Long, Ltd., London, Eng. Price 60 cents. (2s. 6d.) net. This book is written for the guidance of those seeking to enter or those who are already engaged in the engineering profession. It describes methods of training, and where

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers.
We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.
We can finish steel stampings in Nickel, Brass or Copper.
Send us a sample order.

W. H. BANFIELD & SONS
120 Adelaide St. W., Toronto

the training may be obtained, also the possible cost, so that various grades of apprentices will be guided as to which course will be most suitable for them. It defines the scope of engineering in all its branches, comparing it with other professions and indicates qualifications necessary for a successful career. A difficult and complex subject has been handled clearly and intelligently, and a great deal of useful information concerning schools, colleges, and engineering works has been gathered together so that the reader should be able to come to a decision without much difficulty. The book deals entirely with conditions prevailing and with colleges and engineering establishments located within the British Isles. It is, therefore, apparent that it will be read with greater interest by those residing there. The principles involved, however, are well worth studying and can be applied to conditions prevailing in Canada as there is the same need here for a definite system of training apprentices and engineers as in the Old Country. By the process of substitution, the courses outlined in the book could be carried out in Canada. The book is printed in clear type, and the price is within reach of all.

MACHINE TOOL BUILDERS' CONVENTION.

THE Twelfth Annual Convention of the National Machine Tool Builders' Association will be held at the Hotel Astor, New York, Wednesday, Thursday and Friday, October 22, 23 and 24. At the first session Wednesday morning there will be announcement of Convention Committees, call for resolutions, reports of officers and committees, and an address by Clinton H. Scovell, of the Clinton H. Scovell Co., Boston, on "Cost Accounting Practice, with Special Reference to Machine Hour Rate." The programmes for the second session to be held Wednesday afternoon and

The Way to the Job Higher Up

The manager of the largest concern of its kind in Canada recently gave our circulation representative a pass and permission to interview members of their mechanical staff.

This was done because the manager realized that the man who reads his technical paper is more efficient than the man who doesn't.

And the efficient man is the best paid, the most ambitious, and in the end is found at the top of the ladder.

Study your paper carefully and apply the knowledge in your daily work. Keep your subscription renewed so that you will not miss one issue.

The date on the label of your wrapper shows when your subscription expires. **Less than four cents per copy**—two dollars a year—will renew it. Do it promptly in your own interest.

Declaration of Principles

By the Business Press of America

THE Federation of Trade Press Associations in the United States in Eighth Annual Convention assembled at the Hotel Astor, New York, September the 19th, 1913, made the following Declaration of Principles:

1. We believe the basic principle on which every trade paper should build is SERVICE—service to readers and service to advertisers, in a way to promote the welfare of the general public.
2. We believe in TRUTH as applied to the editorial, news and advertising columns.
3. We believe in the utmost frankness regarding circulation.
4. We believe the highest efficiency of the Business Press of America can be secured through CIRCULATIONS OF QUALITY rather than of Quantity—that character, and not mere numbers, should be the criterion by which the value of a publication should be judged.
5. We believe in CO-OPERATION with all those movements in the advertising, printing, publishing and merchandising fields which make for business and social betterment.
6. We believe that the best interests of manufacturers, the Business Press and consumers can be advanced through a greater interchange of facts regarding merchandise and merchandising and to this end invite co-operation by manufacturers and consumers.
7. We believe that the logical medium to carry the message of the manufacturer directly to the distributor and the user is the Business Press.
8. We believe that while many advertising campaigns may profitably employ newspapers, magazines, outdoor display, etc., no well rounded campaign seeking to interest the consumer or user is complete without the Business Press.
9. We believe in co-operating with all interests which are engaged in creative advertising work.
10. We believe that business papers can best serve their trades, industries or professions by being leaders of thought; by keeping their editorial columns independent of the counting room, unbiased and unafraid; by keeping their news columns free from paid reading notices and puffery of all kinds; by refusing to print any advertisement which is mis-leading or which does not measure up to the highest standards of business integrity.

* * * * * * * * * * * * *

These principles, lofty though they may seem, have constituted our platform for years. We preach them and try to practice them.

And you will find, as many successful merchants have found, that consistent and persistent advertising in a journal that is run according to the above principles cannot be anything but an unqualified success.

Rate Card and full information gladly furnished.

PORT OF MONTREAL TRAFFIC.

THE number of arrivals in port of ocean steamers during September was 65, as compared with 57 for September 1912, an increase of 8 for the month. There were 14 Allan liners, 1 Austro-American, 1 Canada, 8 C.P.R., 2 Cunard, 1 Direct, 3 Dominion, 5 Donaldson, 2 Elder-Dempster, 3, Furness, 2 Head, 5 Manchester, 1 New Zealand, 2 Royal, 4 Thomson, 5 White Star liners, and 6 tramp steamers. The combined gross register tonnage of the 65 was 455,220 tons.

The following comparison is made between the arrivals during the present navigation season and that of 1912. From the commencement of navigation until May 31 inclusive, 76 as against 73; for June, 81 as compared with 54; July 72, against 62; August 72, against 56; and September 65 as compared with 57. The total number of steamers from abroad which have entered the port this season is 366, as against 302 last year to September 30, an increase of 64 for the season to date.

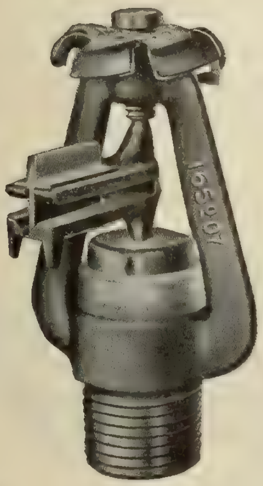
PROSPERITY IS AHEAD!



Canada is about to enter on one of the greatest periods of prosperity she has ever experienced.

Money will circulate freely. Business will be tremendous and every factory will be busy. Optimism will prevail.

You cannot afford to take any chances of having your business crippled by a disastrous fire—it would handicap you for years.

Manufacturers' Automatic Sprinklers

will not only prevent fire, but the insurance premiums they save will pay for their installation in from three to five years.
Why not be on the safe side?

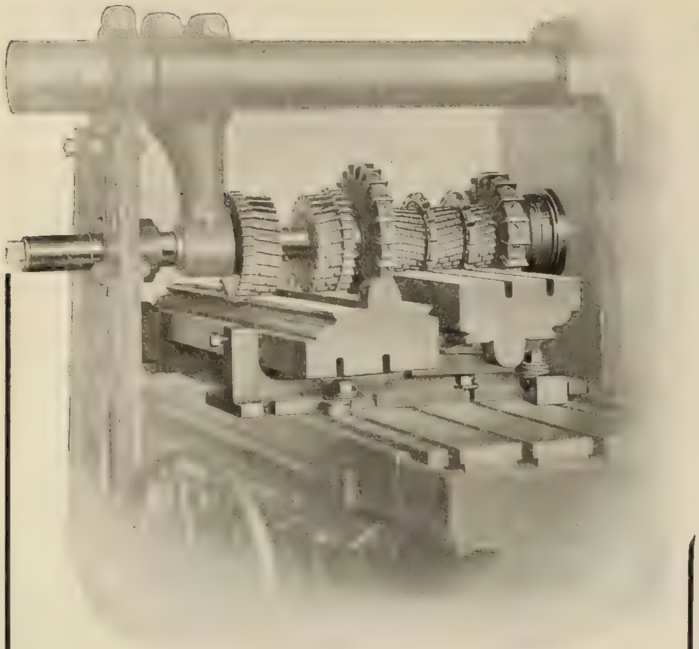
FILE COMPANY
PORT HOPE - CANADA



Here Is The Way To Get Fast Production

If you have manufacturing problems similar to this, read how we mill the pieces.

Two pieces are fastened in place and at one cut the top of one piece and bottom of the other are finished. The table is then run back, the outer piece removed, and the inner piece is put in its place. A new piece is substituted for the inner one and the machine is ready for another cut.

B. & S. Heavy Service Milling Machines

are built for the big jobs. They are powerful and capable of producing accurate work. They are fitted with every convenience to facilitate quick operation and easy handling.

What are the requirements of some of your milling jobs? Perhaps we can show you a more economical way of producing some of your work.

Send for special descriptive circulars of our Nos. 3B Heavy, 4B Heavy and 5B Heavy Plain Milling Machines.

Broken Tangs? Use "Perfect" Double Tang Sockets

What do you do with broken tang drills, otherwise in good shape? With the "Perfect" Double Tang Socket all you have to do is to grind a new tang on the shank below the old one, slip the drill into the socket, and you have practically a new drill—and all done in two to three minutes' time. The new tang is 25 to 60 per cent. stronger.

Folder 19-C gives complete details.

The CLEVELAND Twist Drill Co.

New York CLEVELAND Chicago

Your Work Cannot Move if You use S & S Clamping Devices

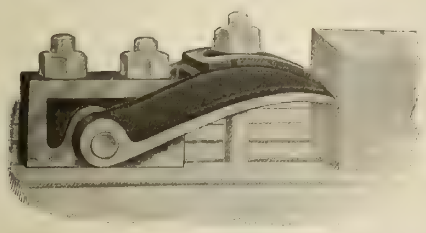

Illustration shows S & S combination clamps which are equally good for side or top clamping.

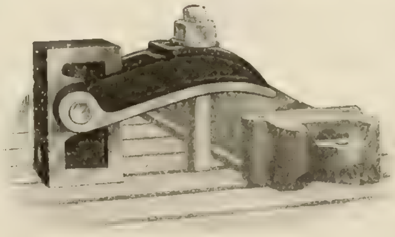
We have them in all styles.

Write us for circular and full information.



SCHUCHARDT & SCHUTTE, 307 Coristine Bldg., Montreal

Geometric Screw-Cutting Die Heads Lead

They are in general use on Screw Machines and Turret Lathes.

Employed in cutting right and left-hand threads of standard or special pitch; also various special forms, such as the Acme, Metric, etc., as well as standard pipe threads.

The chasers are opened automatically, and there is no running back over the work after the thread is cut.

Geometric Die Heads

Can be furnished for cutting any size thread from the smallest screw up to the greatest diameter required.

Tell us your requirements, and we will recommend the Die Head.

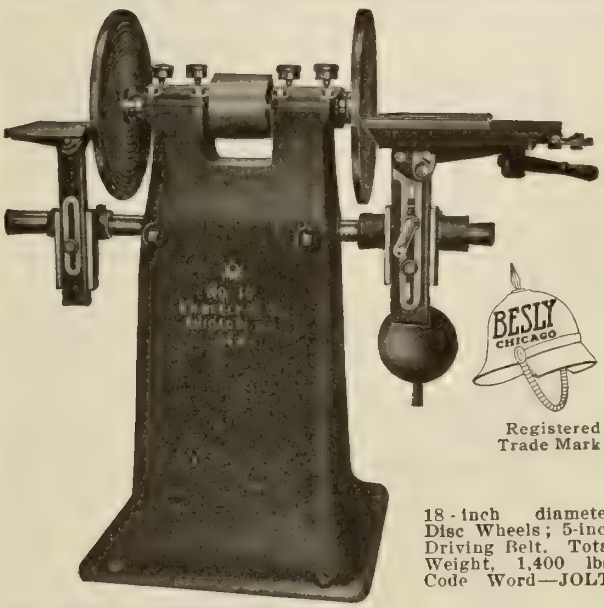
The World's Most Popular DISC GRINDER



Registered Trade Mark

18-inch diameter Disc Wheels; 5-inch Driving Belt. Total Weight, 1,400 lbs. Code Word—JOLT.

NO. 10-18.—G. BESLY GRINDER.

For general Fitting and Finishing, and Manufacturing operations, requiring 18-in. diameter disc wheels.

One of the most useful tools known to machine shop practice.

Costs only Six Cents a Day for Interest on Investment.

Ask us for Details.

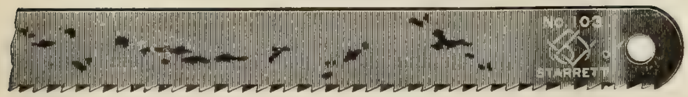
STARRETT
HACK SAWS
CUT QUICKER & LAST LONGER



Saving Precious Minutes

That's done by using the hack saw blade which lasts so long there are no frequent changes—isn't it?

And don't you save still more time with a blade that cuts quicker while it DOES last? You'll find a

Starrett Hack Saw

adapted to every job. It cuts—it lasts. The finest steel goes into its make-up. An improved way of tempering leaves it hard and tough—it won't shell off—it's absolutely uniform throughout.

Every one of the keen, square teeth does its shares of the cutting. That's why it cuts quicker and lasts longer.

Send for Catalog 203.

Consider Your Grinding Department

℄ Every other department in the foundry may be running smoothly—everything working to the highest efficiency point—but you will never have these conditions in your grinding department unless you have

The Right Wheel in the Right Place

℄ For the grinding of castings, big or little, in brass, bronze, grey iron, cast iron, or aluminum, Carborundum will cut faster, give a better finish, last longer. For grinding malleables and steel castings Aloxite is the material that will increase and better your production at the greatest grinding economy.—Our Service Department, if you let your grinding needs be known, will see to it that you get

The Right Wheel in the Right Place

℄ Suppose you discuss your grinding with our representatives at the Foundry and Machine Exhibit, October 10th to 17th, at Chicago, Ill. It will pay you to pay us a visit.

WINDOW GUARDS

For Stores, Warehouses, Factory Basement Windows, etc., and all kinds of

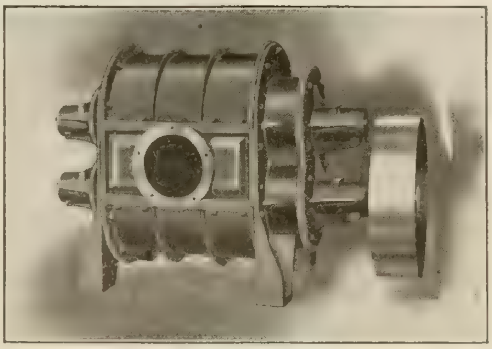
WIRE WORK

Manufactured by

The B. Greening Wire Co., Limited

Hamilton, Ont. Montreal, Que.

BLOWERS



ROTARY POSITIVE PRESSURE TYPE

Weighs less and occupies less space for the same displacement per revolution than any other two-impeller blower.

LET US KNOW YOUR REQUIREMENTS

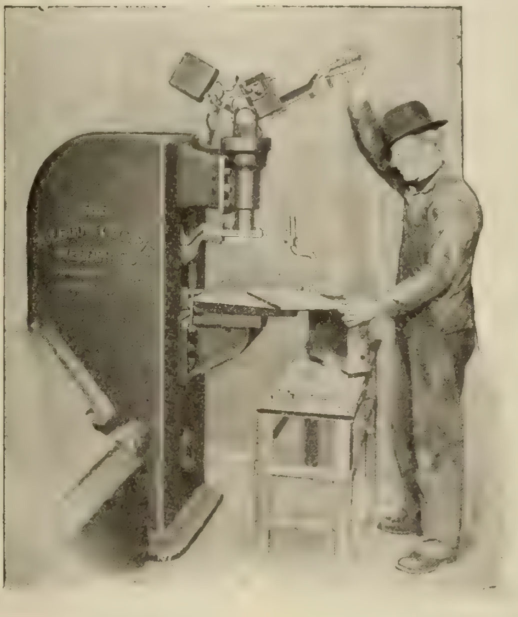
CORRESPONDENCE A PLEASURE

Sherbrooke Machinery Co., LIMITED

SHERBROOKE, QUE.

BLOWER DEPT:

RIVETING COSTS REDUCED



IT'S THE ELECTRIC WAY

The boy shown in the cut is making junction boxes used by electrical people. Instead of punching holes and riveting, he is spot welding them. Why? Because it's cheaper and better than riveting. Our free bulletin No. 12 tells the story. Bulletin No. 11 tells all about butt welding. And we'll tell you all about our free trial proposition.

CASTINGS

MANGANESE BRONZE CASTINGS

We have made a specialty of this material for years and can satisfy your rigid specifications. Our specifications 70,000 to 75,000 tensil strength.
20 per cent.—25 per cent. Elongation.
(Am. Soc. Testing Materials Methods.)

LUMEN BEARING COMPANY
Brass Founders
WEST TORONTO

STEEL CASTINGS

All Sizes, ¼ lb. to 30,000 lbs.

We make **New Process Converter Steel Castings, annealed and unannealed:** also **Chrome-Manganese and Nickel Steel Castings.**

Our Castings are perfect, yet they can be procured at a price that will ensure economy.

Every one guaranteed.

Ask us for estimates.

Ginger Up The Tumbling Room

FORGET the sales force for a minute—they've had their inning. There are other things that need gingering. Just look around your plant — take the tumbling room for instance.

Do you know you could increase its efficiency about fifty per cent. and cut down the cost considerably with

GLOBE TUMBLING BARRELS

In the first place these barrels will save your workmen the trouble of starting and stopping them to refill, empty or inspect the work.

And they'll give you better, smoother finished work. The same barrel can be used for various kinds of tumbling. You simply change the angle at which the barrel is running and you have gentle or violent tumbling.

There are many other reasons why you need Globe Tumbling Barrels and they are explained clearly in our new catalog 2, just off the press. Better write for your copy to-day—it's really a treatise on tumbling.

CLEVELAND SAND RAMMERS

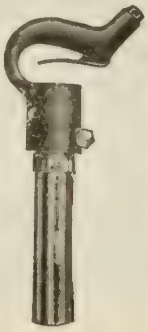
FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.



BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

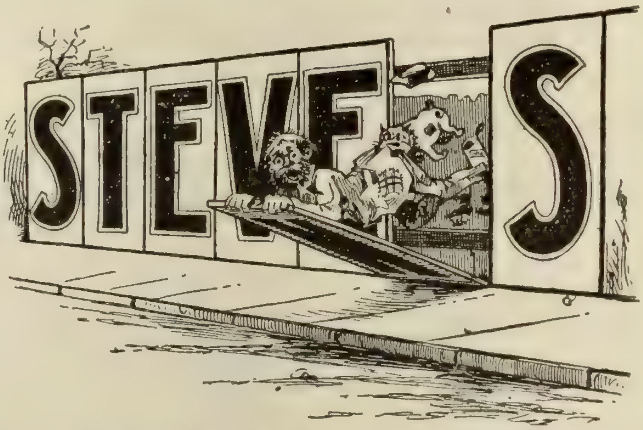
Sand Rammer in operation.



THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

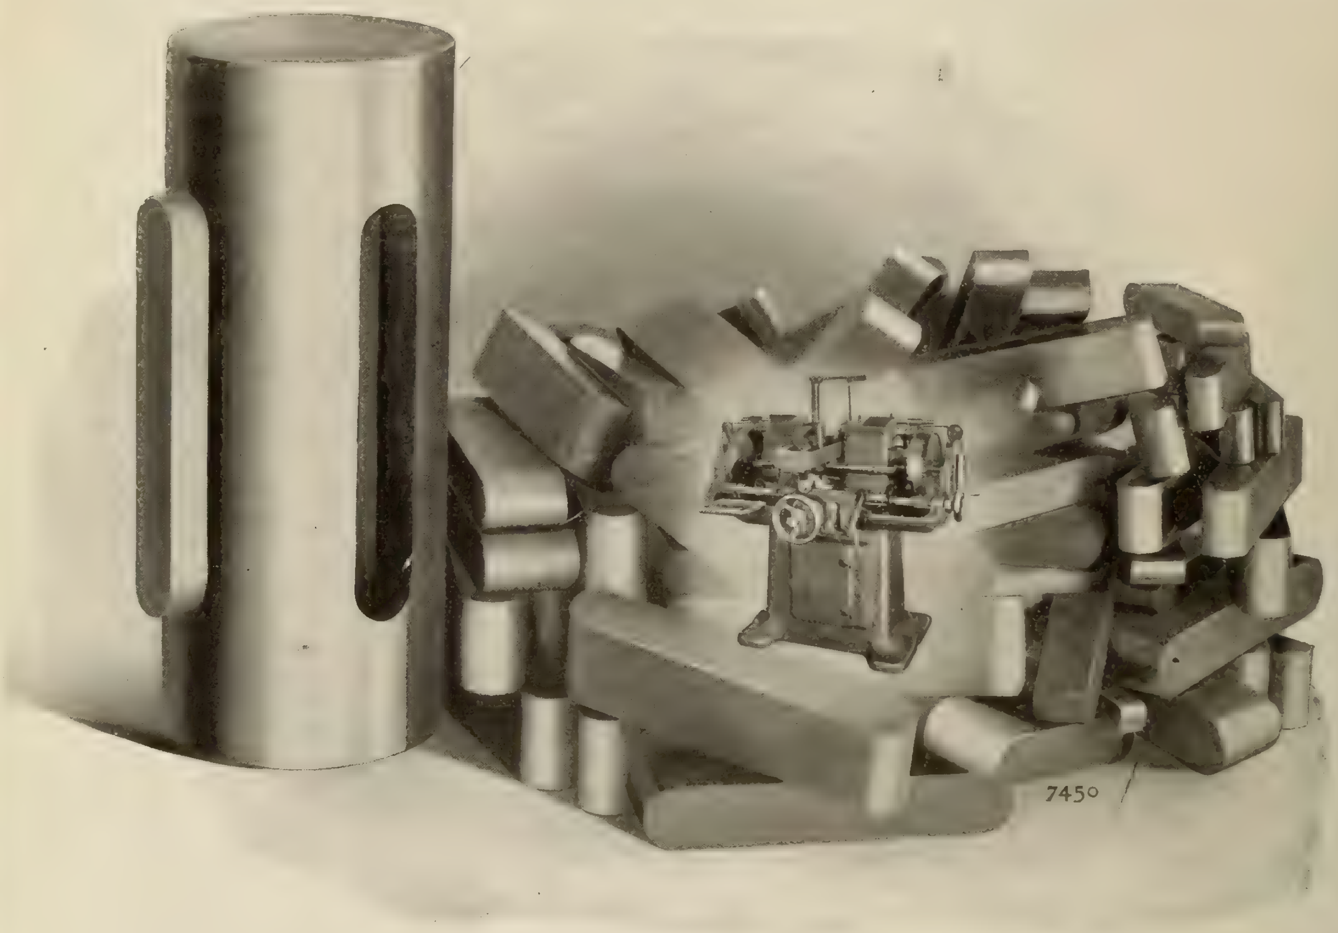
BUILDERS OF MACHINE TOOLS AND WOODWORKING MACHINERY

Install NOW The Most Efficient System of Keying Known

The Round-End Feather Keys. Here is the machine that makes it possible for you to use them as cheaply as others.



The P. & W. Spline Milling Machine

Designed primarily for cutting the keyways for this superior system of keying. It mills the keyways in one simple, rapid operation, eliminating the excessive cost, which has formerly prohibited the general adoption of this system.

Why These Keys Are Best.

1. Do not materially weaken the shaft. 2. Will not work loose. 3. Shearing strength is practically equal to a solid member. 4. Two keys may be placed opposite each other on same shaft.

New Circular Giving Table for Standard System.

Write for our new circular "Spline Milling Machine for use with Round End Feather System of Keying," containing table of system of keying in use at the Pratt & Whitney Works. This standard of keys is the result of thorough study and is recommended to the trade.

Where Keys Can Be Obtained

The Standard Gauge Steel Co., Beaver Falls, Pa., are now manufacturing and carrying in stock Round-End Feather Keys to conform to above mentioned table. This concern is also prepared to furnish special sizes upon short notice.

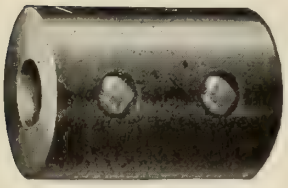
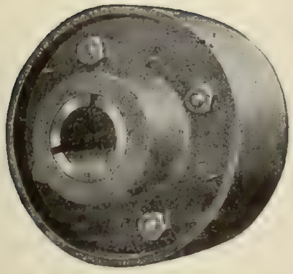
SHAFTING COUPLINGS



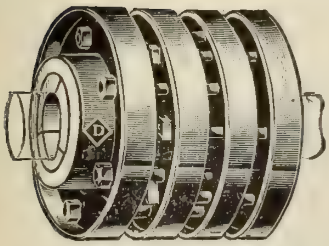
Solid Sleeve

DODGE SOLID SLEEVE

A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.



Single Compression



Double Compression

DODGE KEYLESS COMPRESSION

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.

TOOL GRINDING WITH NORTON WHEELS

Alundum Wheels are widely recognized as the unexcelled grinding wheels for sharpening steel tools—a reputation that increases with each passing year.

WHAT OTHERS SAY—

"A very cool, free-cutting wheel; works well dry without burning"—on small high-speed steel tools.

"Hold their shape and cut the steel either red hot or cold"—in the manufacture of air-hardening steel tools.

We make Alundum Grinding Wheels of regular or special temper to meet every tool sharpening requirement. Let us prove it to you.

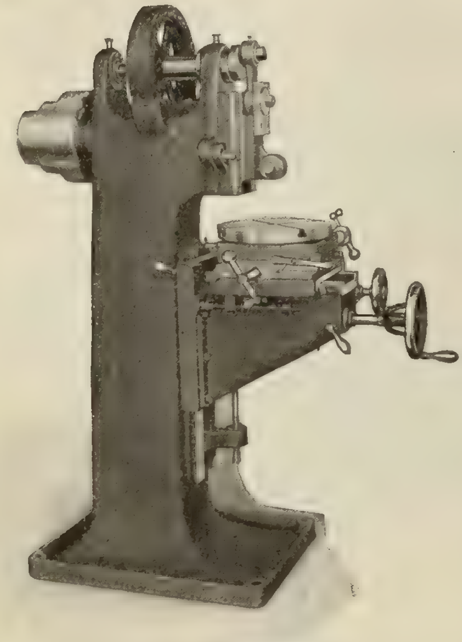
GARVIN
Die Slotting Machine

For All Die Work,
Key Seating and
Small Slotting



Garvin Die Slotting Machine.
Use Code—Quietus.

This tool is well adapted to all die work, small key seating, both straight and taper; also internal or external gear patterns, where draught is required and all that class of common slotting. The two cross motions and the rotary table provide for following any outline.

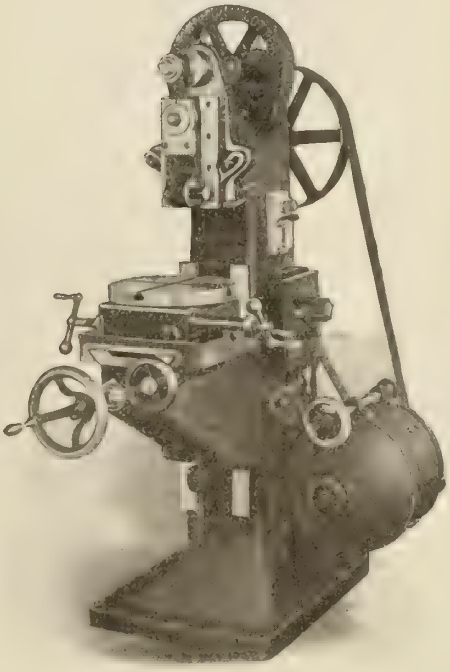
The stroke of the machine has been fixed at 3½ inches, which is ample for the class of work for which this machine is intended and affords greater strength than an adjustable pin.

The speed can be changed by means of the cone pulley.

The slide for the ram can be swiveled 5 degrees either way and set by a graduated index, thereby insuring the same draught to every part of the die.

Adjustments—7 x 5½ x 11½ in.

GARVIN Die Slotting Machines are used by many prominent concerns and large manufacturers. Are you in need of a slotting machine?



Die Slotter with Motor Application.

The Ford-Smith Machine Company - Hamilton, Ont.

Universal and Tool Grinding Machine

This machine is designed to meet the requirements of the tool room in the grinding of milling cutters, formed cutters, straddle and face mills, beveled cutters of any angle, straight or taper reamers, etc., and in addition cylindrical grinding, either straight or taper, can be done.

BROWN & SHARPE

The problem of permanent accuracy, so essential in Tool Grinding Machines, is solved by the B. and S. design and careful workmanship.

Accuracy demands both ample rigidity and correct alignment. Continued service, extending over long periods of time, is the test to which hundreds of B. & S. machines have been subjected.

If you are interested in the machine shown here ask for Bulletin of the B. & S. number 13 Universal and Tool Grinder Machine.

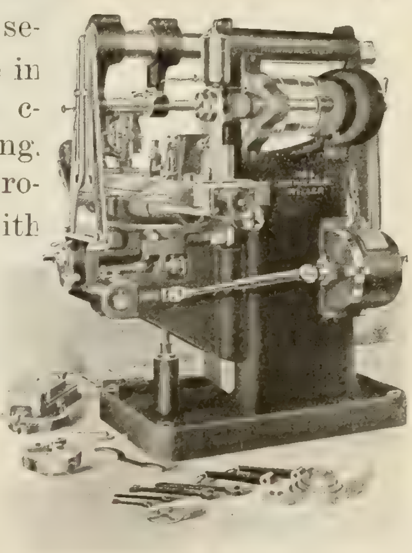
The KEMPSMITH MASSIVE KNEE

helps the milling machine to **stand up** to steady, severe service in manufacturing milling. Generous proportions, with abundance of metal thrown where it is most needed—for instance, around the bearings on the column. See also the length of these bearings. The whole machine is built along the same massive lines.



Built in "The Model Plant for Specialized Machine Manufacture."

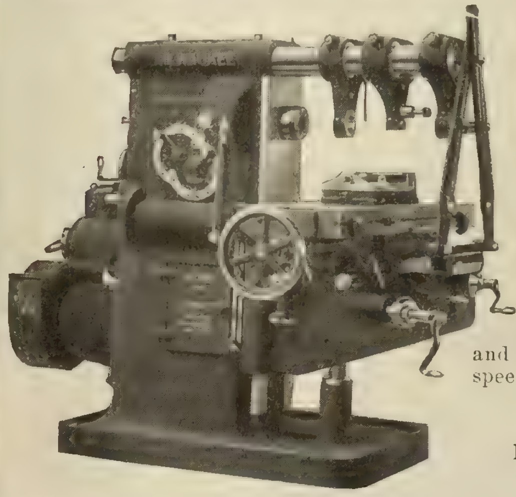
KEMPSMITH MFG. COMPANY, Milwaukee, Wis.

WHY MILWAUKEE MILLERS

Are Built Exactly As They Are

No. 10—
Speeds

We used to make the speed-change gearing of cast iron—for that was general practice when we first started manufacturing Milwaukee Millers, and still is with some—but it was not long before we concluded that cast iron gearing was not giving the entire satisfaction which we demanded of every detail of our machines.



So we made this gearing of hardened steel. But hardened steel gearing is most satisfactory only when suitable provision is made for its lubrication.

The unique and effective cascade lubrication system which is a feature of every Milwaukee Miller, makes such provision, and it not only thoroughly lubricates the gearing but also keeps it free from all foreign matter by flushing it with a continuous stream of fresh oil.

The combination of highly finished, hardened steel gearing and cascade lubrication secures a speed arrangement which it is almost impossible to wear out, and which is a constant source of satisfaction to Milwaukee Miller users.

18 speed changes are provided in ratio of 1.25. The hand wheel shaft below the spindle carries two gears of different diameters, and the tumbler is so arranged that each one of its three steps can be engaged with each of these two gears, giving six speed changes. These are multiplied by three through the sliding sleeve gear on the spindle, which is made to engage with the main spindle drive gear, or either of the two gears on the hand wheel shaft. The simplicity and positive operation of this arrangement is greatly appreciated by all machinists.

All these weekly "WHYS" are amplified in our Bulletins. Have you your copies? We'll mail them promptly if you'll drop us a postal.

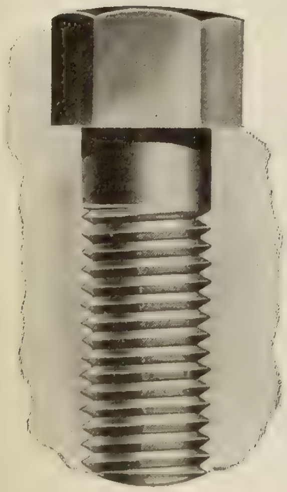
ACCURACY



Accurate, high grade Cap and Set Screws should contain the following essentials:

1st.—Best Material.

2nd.—Uniformity of thread depth.

3rd.—Pitch accuracy.

4th.—Concentricity of thread with body.

5th.—Parallel sides of heads.

Galt Screws have all of the above cardinal points of quality. Try them and be convinced.

Big stock of Finished and Semi-finished Hexagon Nuts.

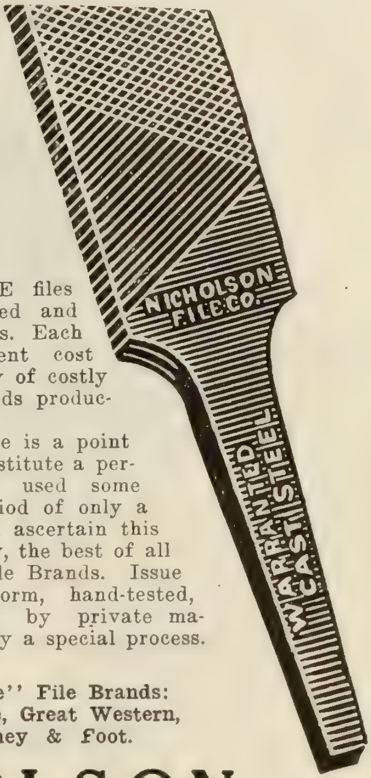
FILE
EFFICIENCY IS
MAN
EFFICIENCY



NICHOLSON-MADE files are sharp-toothed and fast-cutting tools. Each file at 15, 20, or 25-cent cost maintains the efficiency of costly skilled labor, and speeds production by that labor.

In each factory there is a point at which it pays to substitute a perfectly new file for one used some time, sometimes a period of only a few hours. When you ascertain this period for your factory, the best of all files are Nicholson-made Brands. Issue them—they are uniform, hand-tested, made in special steel, by private machines, and hardened by a special process. At all jobbers.

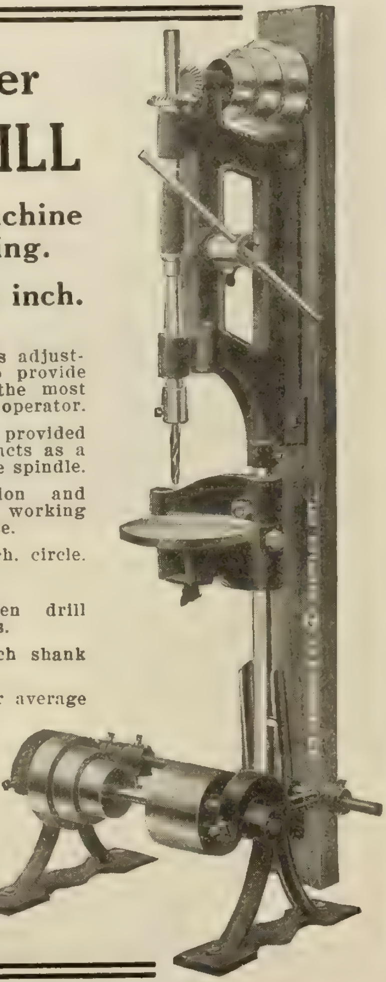
PORT HOPE CANADA

16 in. Lever
POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½ inch shank twist drills.

Speed of countershaft for average **work, 300 per minute.**

The 'Illusion' of Success.

¶ The man who succeeds at thirty is often a failure at forty. The mushroom grows in a single night; the morning glory blossoms between the setting and the rising of the sun, and fades and dies with the first few hours of the coming day.

¶ The material which constitutes a great oak tree is wood fibre, and this is to a very great extent the same material which constitutes the mushroom and the morning glory. The life of an oak tree is perhaps many hundreds of years—the life of a mushroom but a few days; the life of a morning glory but a single night.

¶ The oak grows slowly, by a long and tedious process, develops roots which extend in toward the heart of the earth—grows a massive trunk with which to support great outspreading branches. The mushroom—the toadstool, have practically no roots, and by a single brush of the hand or a tiny pressure of the toe are broken down and destroyed. The mushroom and the toadstool have little more than enough resisting power to carry their own weight.

¶ The process of growth represented in the oak is the kind of evolution or growth which is permanent, lasting—the kind of evolution which is beautiful, dependable, constant and continuous, extending over a period that makes a well-rounded life, full of beauty, strength and individuality. Upon the basis of this growth a long life is maintained, as this life, this beauty, this permanency, is the result of years of labor.

¶ There is a disposition on the part of men who have made a fair success, who have done reasonably well, to believe that they have realized their ambitions, and that they have tasted all that life holds in store for them.

¶ The greatest success is attained much on the same principle as the success of a man like Thomas Edison, who has constantly astounded the world with new discoveries, new and wonderful inventions, and who, perhaps, has done the world more actual good than any other man who has ever lived. At least, it is easy to specifically point to the way in which Edison has actually benefited his fellowmen.

¶ We observe a great many men in business, around the age of thirty, who have made considerable money, who own an automobile and have acquired a certain amount of what we style "worldly goods." In reality this is the critical period in the life of an individual. There is but one thing which we can do under conditions of poverty, but there are many things which we can do under conditions of prosperity. There is considerable question as to what most of us would do were we clothed with absolute power or authority, or placed in possession of unlimited wealth.

¶ If a man's growth is constant, continuous, and extends over a long period of years, if a man is more of a man at the age of forty than he was at the age of thirty, then he is the type which represents the finest character, the noblest ambition, and the purest aspiration of that something in nature we call the Divine. The ambition to succeed at an early age is all fine and good, but an ambition to be a still greater success, to accomplish more and more as the years pass on, is something better and far more beautiful.

¶ The other day a man said, "I started in at the bottom and finally reached the top," forgetting that there are heights to which no man has ever reached, and that there are depths which have never yet been explored. Human nature is shrouded in the illusion that success is a matter of position, when in very truth success is a matter of growing from one position into a higher position—a matter of developing from something to something better.

¶ A little prosperity is poison to many men. They get too much of a thing and become mentally and physically sick, and budding enthusiasm, energy, growth and evolution turn to the dust and worm-wood of mental, moral and physical decay.

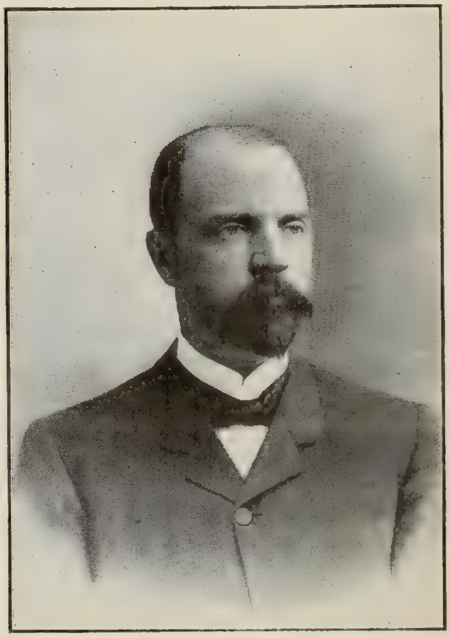
JOHN BELLAMY MILLER

THE subject of this biographical sketch, John Bellamy Miller, was born July 26th, 1862, at Farmersville (now Athens), Leeds County, Ontario. His father was John Clausin Miller, a member of the Provincial Parliament, and Lumberman of Parry Sound, Ontario. Up to the time of his death, in 1884, he was president of the Parry Sound Lumber Company. He was of German descent, his ancestors coming to this country with the Hessians during the Revolutionary War, so that for the past five generations the family has been of Canadian birth. Mr. Miller's mother, Adelaide Augusta Chamberlain, is of English ancestry, her forbears coming to America about the period of the Mayflower. Mr. Miller received his education at the Toronto Model School and in the Upper Canada College.

Following his educational training, Mr. Miller entered the lumber business with the Parry Sound Lumber Co. as clerk, and while holding this position mastered every detail of lumber manufacturing. In 1883, following his father's death, John B. Miller took complete charge of the business, and was made president of the company, which position he still holds. He is also president of the Polson Iron Works, Limited, of Toronto, and holds a like position in the Polson Dry Dock and Shipbuilding Co. of Toronto.



J. B. MILLER.
President, The Polson Ironworks, Ltd.,
Toronto.

Added to the above, Mr. Miller is president of the Parry Sound Transportation Co., president of the Consumers Box Co., of Toronto, and director in Plastics, Limited, of Toronto; also was largely instrumental in the formation of the Canadian Lumberman's Association, of which he is president.

However vigorous and trying his duties, they do not prevent Mr. Miller from club recreation, for he holds membership in the following clubs:—The National, the Royal Canadian Yacht, the Ontario and the Rosedale Golf Clubs, of Toronto; Granite Curling Club, also the Rideau and Laurentian Clubs of Ottawa.

Mr. Miller was married October 3rd, 1883, to Hannah Pollock Hunter. Mrs. Miller died in 1893 By this marriage there were two sons, John Clausin Miller and Henry H. Miller. Mr. Miller's second marriage occurred September 22nd, 1897, to Jessie Thompson, of Longford, Ontario, a daughter of John Thompson, a prominent lumberman of that place. One daughter survives this union.

Plant of Moffat-Irving Electric Smelters, Ltd., Toronto

Staff Article

The electric furnace is rapidly passing from the experimental stage to a commercial basis; the following description of a new type of furnace and process introduced into Canada should therefore be of interest to our readers generally, but perhaps more particularly to those engaged in the manufacture and utilization of steel castings, as there is evidence of a radical change imminent in this sphere, due to electricity becoming available at a favorable rate, on account of our large water power resources.

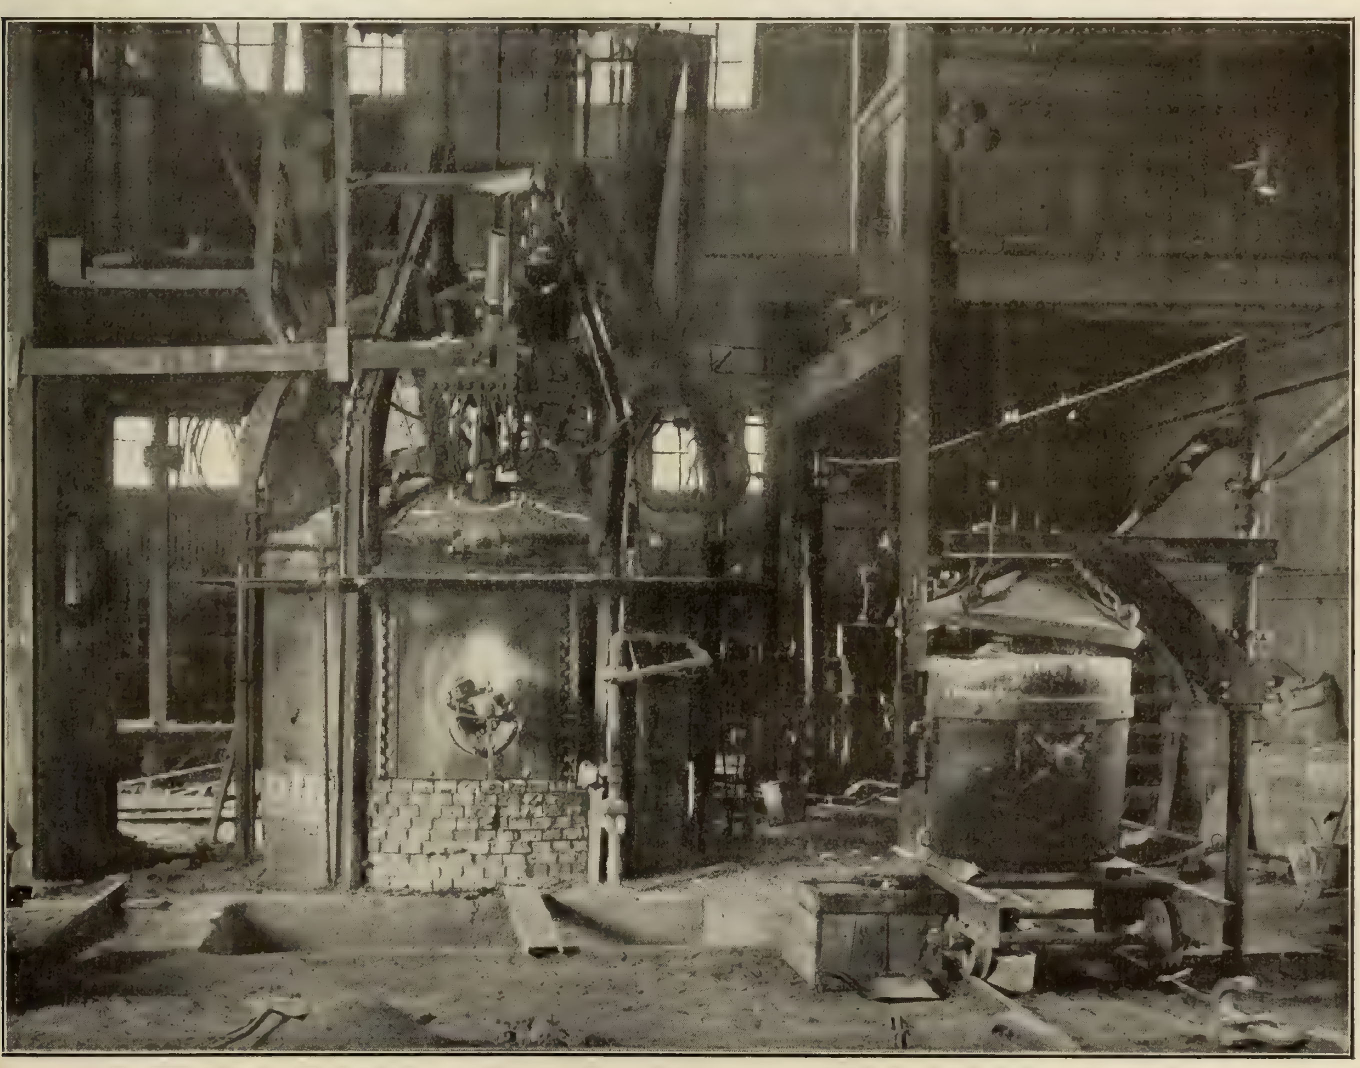
THE smelting of iron ore by electrical means is a process that has been closely investigated by many metallurgists in recent years. Electric furnaces of varied types are now being operated on a successful commercial basis in Europe and the United States, but in Canada, apart from experiments conducted by the Government, little has so far been done. Castings of high tensile strength, clean, free from blow holes, and of high grade quality are, we understand, being turned out at the Moffat & Irving plant here described.

Mr. James W. Moffat has been making investigations for a number of years, and after much experimenting has finally evolved the process and designed the furnace which is the subject of this article. Mr. Moffat is associated with Mr. T. C. Irving, jun., who is a prominent steel plant engineer, and together they form the company called the Moffat-Irving Electric Smelters, Ltd., Toronto.

Electric Smelting Process.

The need of a process to smelt finely pulverized ores has been greatly felt. Our Canadian iron ores in particular required concentration to free them of impurities. Large bodies of magnetic iron sands exist on the shores of Lake Superior and the St. Lawrence River and Gulf, and a process was wanted that would permit these to be smelted as fines, and without the added cost of briquetting, nodulizing or sintering. Other fines were also available in the shape of flue dust from the blast furnaces and the mill scale from rolling mills. To smelt these fines alone without any danger from explosions, to utilize the calorific power of the furnace gases as much as possible, and to avoid the cost of briquetting, nodulizing or sintering them, led to the design of the furnace here described.

In the blast furnaces the reducing gases generated at the tuyeres find their way upwards through the voids in the descending charge of lump ore, lump limestone and lump coke, and effect the reduction of the ore in their passage through. Ore, when in the shape of fines, will fill up these voids and prevent the even working of the furnace, so only a limited amount of them can be used with safety. Sometimes when the downcoming charge reaches the zone where the temperature renders them pasty, the fines will close



ELECTRIC FURNACE INSTALLATION. MOFFAT-IRVING ELECTRIC SMELTERS, LTD., TORONTO.

up the voids entirely and prevent temporarily the upward passage of the gases, and as the gas is still being formed around the tuyeres, the pressure increases until the charge slips with explosive force, or the top of the furnace is blown off.

The idea occurred to those working on it that a furnace could be designed to handle fines only and safely by reversing the conditions in the blast furnace; that instead of the reducing gases being made to find their way through the voids in the charge, the charge in the finely crushed state could be successfully showered in an uninterrupted stream through a body of reducing gas, and that it was all the more possible with an electric furnace which required no air blast in its operation. After considerable experimental work, a furnace was designed and erected by the Moffat-Irving Electric Smelters, Ltd., at their works on Front Street East, Toronto, using 300 k.w. and having a capacity of 3,000 pounds of metal in its crucible. It has many advantages, such as:

Advantages.

The concentration of the ores to a high metallic content reduces the amount of flux required and the loss of heat wasted in melting the slag making materials; it is cheaper to take the impurities out of the ore by some concentration process costing a few cents per ton of crude ore than to take it out as slag with electric heat at a cost of many dollars; scaffolding and slips in the furnace do not occur; the feed of the charge of fines can be easily regulated, and the carbon can be introduced into the furnace at a point close above the bath, where none of it will be burned to carbon-dioxide, as happens with the blast furnace; the cheaper forms of carbon only are required, such as coke breeze, slack coal or charcoal dust; the ore, flux, and carbon are charged separately, and this enables their ratio to each other to be varied instantaneously, and the change immediately affects the molten bath in the crucible. There being no column of descending charge, the crucible may be of the tilting type, and the furnace may be operated continuously or intermittently for the same reason.

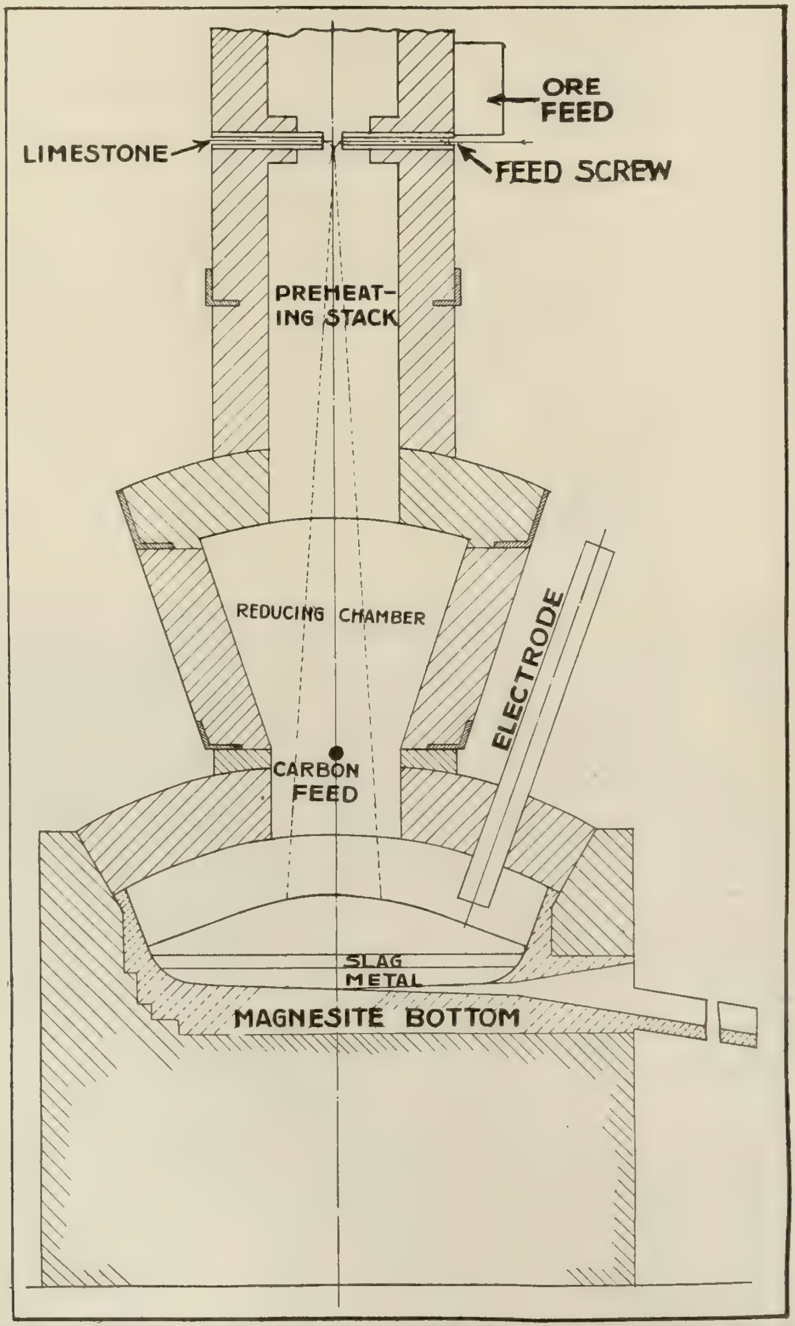


DIAGRAM OF FURNACE, MOFFAT-IRVING ELECTRIC SMELTERS, LTD., TORONTO.

Operation Features.

The furnace can be operated on ore only, on any pig and ore process, or on scrap metallic fines and pig iron. The refining of the molten metal is carried on just as in the open hearth furnace of to-day, the only difference being that the heat required to do the work is supplied by electricity instead of gas. A basic bottom of magnesite, brought from Austria, is used.

Finished Steel Analysis.

Recently the Company has been working it with charges of metallic fines and scrap metal. Their finished steel has the following analysis:—

Carbon—0.25 to 0.35 or 0.40 of 1%
Silicon—0.27 to 0.30 of 1%
Manganese—0.65 to 0.70 of 1%
Sulphur—0.02 to 0.04 of 1%
Phosphorus—0.02 to 0.04 of 1%

The ultimate tensile strength of this metal is between 75,000 and 90,000 lbs. per square inch. In quality it is equal to crucible steel or even better. Compared with open hearth steel, that made in any of the electric furnaces is better, and this is due to the different conditions existing in the two furnaces. In the electric furnace the molten metal is lying under an atmosphere far more deoxidizing than can be found in any open hearth, and it can be held there longer with safety to allow suspended matter to separate and come to the surface. The electric furnace steel is much freer from carbonic-oxide, which is the cause of the blow holes so frequently found in steel.

The furnace is also practically air tight, so no hydrogen and nitrogen can enter the metal, two elements that are carried in with the gas used in the open hearth process, and are actually blown through the molten metal with the air blast in the case of the converter process. Both of these elements have long been considered deleterious to the quality of steel.

Patent Rights.

Very basic patents have been issued to the Company on the process in Canada, United States, Mexico, Brazil, Great Britain, Norway, France and other countries. It is their intention to erect a larger plant as soon as a suitable location can be secured in Toronto or elsewhere, and to instal larger furnaces, each using about 1,000 k.w. of electricity. Such a plant, it is stated, would employ at least 500 men. They have already made many steel castings for large firms in the iron and machinery trades, and as a sample of the working efficiency of their steel, they quote the case of the Consumers Gas Co., Toronto.

The pusher heads of the machine charging their retorts have in the past been made of the best steel forgings procurable. The life of these has been from four to eight days continuous service of 24 hours. They are operated under extremely severe conditions, the temperatures of the retorts in which they enter and push a load of about a ton every five minutes of the 24 hours being kept at about 1,800 degs. Fahrenheit. To keep the pusher heads somewhat cool, cold water is thrown on them as they are withdrawn, a service every user of steel will at once recognize as being about as severe as any known. The castings supplied by this company for the work are having a life of from eight to ten weeks.

PLANT EXTERIOR, MOFFAT-IRVING ELECTRIC SMELTERS, LTD., TORONTO.

Electric Furnace Feature.

The diagram shows the general outline of the furnace without the steel framing. The raw materials, ore and limestone, are carried to the charging floor above the feed boxes by a bucket conveyor, each class of material being stored in separate boxes or hoppers above the screw feed conveyors which are mechanically operated, and which feed the materials into the furnace. These materials have previously been pulverized to a finely divided state, and after being fed into the furnace, fall down in the form of a shower, as indicated by the dotted lines in the diagram. Below the reducing chamber, carbon in the form of pulverized coke, is fed into the furnace in a manner similar to the other materials. Air is introduced at the top of the reducing chamber to burn the escaping carbon-monoxide in the waste gases to carbon-dioxide, and so add to the heat in the reduction chamber. The slag is drawn off through a door at the back; scrap can also be fed through this door when desirable.

There are three electrodes made of graphite, and using three-phase current at about 65 volts. The electrodes are operated from a control station nearby, and can be raised or lowered by the operator, when necessary, to equalize the amount of current being used by each. This is indicated by three ammeters situated in front of the operator. In the transformer house is a Packard oil insulated water-cooled transformer, receiving current at 12,200 volts and transforming it down to 65 volts. The chambers through which the electrodes enter the furnace have water jackets, so have the clamps holding the electrodes, and also the bottom charging door, through which the slag is withdrawn. When the furnace has been warmed up, a heat can be drawn in a comparatively short time, the heat being so intense, and practically only limited by the ability of the firebricks to stand up to it without melting.

A feature about the construction of the furnace is the way in which the various sections are supported, independently, by the framework. The steel frame carries each section, so that if, say, the brickwork forming the reducing chamber required renewing, the stack would remain intact; also if the roof of the furnace required repairing, this could be done without affecting the reducing chamber above. The angle castings shown in the diagram are connected to the frame, and support their respective sections.

At the present time flue dust obtained from blast furnaces is being used in preference to lump ore, as it is in a finely divided state and can be readily concentrated to contain a high percentage of iron, thus making it a very suitable material for using in electric furnaces.

Foundry Features.

The building in which the furnace is situated lies at the eastern section of the property, and is 74 x 34 feet. That portion of the floor not occupied by the furnace and its auxiliaries is used as a foundry, the moulds being brought from the moulding shop ready for pouring. The building is equipped with an overhead runway, which carries a 2-ton Simplex chain block. Tracks run along each side of the building. There is an oil burner for heating the ladles, the oil being delivered by a rotary pump from a tank of 625 gallons' capacity, located outside the building. The air is supplied by a Garden City rotary blower. A 10 h.p. Can. General Electric motor drives the blower, oil pump, conveyor, grinders, etc. There is a blacksmith's forge in this building. There are three 1½ ton ladles, bottom pouring type, supplied by the E. J. Woodison Co., Toronto, and made by Byram & Co., Detroit, Mich.

Moulding Shop.

The moulding shop has a floor space 100 x 42 ft., and contains, besides the requisite number of flasks, a sand grinding mill, a 2-ton air hoist carried by an overhead runway, and a drying oven, heated by a coke fire. Tracks are laid throughout the building. In one section is a balcony carrying a pulverizer supplied by the Jeffery Mfg. Co., Montreal, and a magnetic separator supplied by Ball & Norton, Troy, N.Y. As already stated, the materials used in the furnace have to be of fine proportions, and for this reason are passed through the pulverizer.

A conveyor carries the materials from the floor to the pulverizer, where they are reduced to the desired degree of fineness. The magnetic separator is used for extracting the magnetic iron from the flue dust, already referred to. The dust is carried on a rubber endless belt under a series of magnets, under which also is carried a rubber endless belt. The magnets extract the iron ore, which is deposited into a hopper, while the residue is carried away. This plant is operated by a 15 h.p. Can. General Electric motor.

Air Compressor.

Adjoining the moulding shop is a building, 84 x 18 ft., which is sub-divided into offices, cleaning shop and compressor room. In the latter is a "Sentinel" air compressor, supplied by Alley & MacLellan, Glasgow, Scotland, and driven by a 50 h.p. Can. General Electric A.C. motor at 550 volts. The compressor has a capacity of 300 cubic feet of free air per minute, and supplies air for various purposes, such as hoists, moulding machines, sand blast, etc. In the same shop is a Robertson No. 5 power hack saw machine supplied by Canadian Fairbanks-Morse Co., Toronto, and driven by a 2 h.p. Packard motor. The cleaning room, adjoining, contains a swing grinder and a No. 6 stand grinder, both supplied by the Gray Mfg. & Machine Co., Toronto, chipping tools, and rumbler. An oxy-acetylene welding plant, supplied by Kauert & Doehler Co., Montreal, and equipped with Masser torches, forms a further interesting unit of the general installation. There is also a sand blast outfit in connection with this department.

FIRE BRICK IN CUPOLA PRACTICE.*

By E. J. Woodison.**

THE subject of fire brick in cupola practice is a big one, because it must be viewed from many angles, and in this paper I am going to confine myself to cupola practice only, passing by malleable, steel and other furnaces used in the melting of iron, all of which present interesting problems.

First of all, let us consider what we have to contend with in the cupola. The answer, I think you will agree with me, is sudden heating and sudden cooling, each of which mean quick expansion and quick contraction respectively. It must of necessity be a very refractory material that can range from a temperature of, say, 70 to 2,370 degrees (the necessary heat from melting iron to a white color) in as short a time as 30 minutes, and then drop back to normal in a few hours.

There is an erroneous idea that friction does more harm than heat; this is wrong, as is evident by the blast furnace. A blast furnace makes, say, 100 tons of iron per day, and to accomplish this they must smelt 350 tons of iron ore together with the necessary amount of coke and limestone. Now, the blast furnace runs continually for two, three or four years without stopping, and the lining lasts until it goes out of blast; in other words, shuts down. It would, therefore, seem that friction has little to do with the life of a cupola lining. My contention is that the continual expansion and contraction disintegrates the lining, with the result that it melts down, or, when the bond is destroyed, spalls off.

During an experience of twenty-five years in the fire brick business I have found that brick adaptable for oil furnaces under pressure, malleable iron in the cupola does not work as satisfactorily as brick made, especially for cupola practice; yet more money frequently is paid for higher grades of brick. I say higher grades, because it is conceded they are higher grade for some purposes, although not so for the cupola.

Cupola Blocks and Bricks.

Cupola blocks and brick have to be very carefully handled in their manufacture to prove satisfactory in your practice. I have frequently seen good cupola blocks spoiled because they were hastily dried, instead of being allowed to remain on the drying floor until the moisture was well dried out of the same before placing in the kiln. Again, I have seen cupola blocks taken out of the kiln before they were properly burned, with the result that those blocks would quickly spall off. All moisture should be thoroughly burned out; no green centre, otherwise they will not stand expansion and contraction.

I recall, some years ago, getting a new fire brick manufacturer to make cupola blocks for me. I told him how I wanted the mixture treated and cured. While at the works for a couple of days looking around, I found that they were not carrying out my ideas at all, that they were only allowing them to remain on the drying floor a short time, and owing to having considerable work on hand, were taking them out of the kiln before they were properly burned. Shortly after I got quite a number of complaints from people who had purchased the material, and naturally understood why such was the case.

It is surprising how little a great many fire brick manufacturers know of what is needed for cupola practice. Some of them figure that if they make proper sizes and of proper radius that nothing more is required. As regards actual cupola practice, their knowledge is very limited; yet as each of you know from your foundry experience, it takes a brick of exceptional ability to act serviceably in a cupola lining. In my experience I have found that it was not necessary alone to educate the manufacturer into the actual component parts necessary, the method and length of time required in drying, but in the method of placing in the kiln and burning.

One manufacturer who made cupola blocks for us placed them over the fire arches. The result was, they were burned so hard that they would not expand and contract. Still, another placed the cupola blocks in the top part of the kiln where they did not get fired enough, and were soft, which meant that they were only skin burned. When they were placed in the cupola after the heat had bungs and such like work, when placed penetrated the surface, they spalled off.

Slag should be kept in a fluid condition by the use of limestone, oyster or clam shells or by fluor spar. A much better drop will be had, less chipping will be necessary, which in turn means less labor in building up your bosh. Right here it might be well to admonish. Don't build up your lining with clay if the hole is large enough to put in a piece of brick. Place the clay or daubing on thin, and, if possible, gradually build the lining up to normal. Using clay or daubing one inch thick is a poor method, for as it dries it contracts; cracks appear, and it spalls off.

In the selection of a proper refractory it would seem that the point to consider is securing a brick which will stand expansion and contraction and eliminate the question of friction. See that your cupola tender lays the brick right, and, instead of plastering them in the cupola, have him dip in clay mixture made to the consistency of molasses. Keep your brick in a dry place. Some foundrymen leave them out in the weather. They go to pieces shortly after being placed in the cupola as a result, and the brick is consequently condemned, because its efficiency was destroyed before it got in the cupola. If perchance they did get wet, and you use them, be sure to keep a good fire in the cupola for eight or ten hours to dry out the moisture.

MIXTURES FOR REFRACTORY CASTINGS.

ESPECIALLY suitable for refractory castings, says "Giesserei-Zeitung," is a special mixing iron with low-silicon content, about 0.5 to 1 per cent., and moderate manganese content, about 1.5 per cent. Manifestly, the phosphorous content also must be kept as low as possible. As another ingredient for refractory castings, may be considered cast steel or wrought iron, steel briquettes being especially appropriate.

Refractory cast iron itself should have about the following composition:

Silicon	1.4 to 1.5 per cent.
Manganese	0.6 to 0.8 per cent.
Phosphorus	0.3 to 0.4 per cent.
Sulphur	0.06 to 0.07 per cent.

The following are two mixtures for castings with quite thick walls:

Hematite, 35 per cent. Mixing iron, 25 per cent. (Silicon, 0.5 to 1 per cent.) Good scrap, 20 per cent. Steel, 20 per cent.

Hematite, 25 per cent. Low-carbon iron, 25 per cent. Good scrap, 25 per cent. Steel, 25 per cent.

Selecting the Proper Wheel for Grinding Castings*

By G. T. Estabrook

The development and application of grinding equipments in the preparation and production of machinery details and accessories are among the prominent features to be noted in modern engineering workshops embracing a wide range of specialties. Articles dealing with the different phases of the subject are, therefore, generally eagerly perused for their instructive value.

WHILE the choosing of the proper wheel for rough grinding castings of various metals is a comparatively easy proposition, at the same time it is a subject worthy of some consideration. As in fine grinding, a study of the conditions encountered in the different shops and foundries is of great assistance in determining the proper wheel to choose. The first thing to do is to ascertain everything possible pertaining to the particular class of work in hand. This information is apt to be taken in a broad sense; for instance, it may be gray-iron castings which are to be ground, and this only considered when choosing the wheel.

Metal of Castings Classification.

It pays to draw the line finer and ascertain what the grade of iron may be. We all know that stove castings are made of a mix to produce a fine-grained, soft and even iron. This also applies in many cases to high-grade machinery castings. It is in the so-called job foundry that the metal will show a greater variation and, as a rule, run coarser and harder. Other conditions being equal, a harder grade wheel can be used for grinding fine soft iron than is used for the harder, coarser metal, and still cut as freely.

In both large and small foundries the superintendents or foremen are so familiar with the conditions themselves that in ordering a wheel they sometimes take it for granted that the wheel manufacturer will also know what is required without having these details. This is a mistake which is often committed unknowingly, and its elimination will go a long way towards getting the right wheel in the right place.

If this close classification of metal is required of gray iron, it certainly is of malleable iron. It would almost seem that no two foundries make a malleable iron even nearly alike, and any superintendent will admit that this kind of metal will vary in hardness from time to time, even if the mixture is identical in every case. This applies to furnace rather than to cupola malleable iron. The proper way to grind the latter is before it is annealed, and it requires a wheel but little different than one used for grinding gray-iron castings. On brass and composition castings, such close classification is not necessary, as the same wheel will take care of all kinds of mixtures except straight aluminum or copper.

The Speed Question.

The speed question, of course, is of some importance, and must be taken into consideration. A surface speed in excess of 5,000 feet for rough grinding is unnecessary, although some manufacturers run their wheels at a speed much greater than recommended, and claim better results. It would appear better to use a harder grade of wheel in conjunction with a lower speed, thus using less power, causing less wear and tear on bearings,, etc., and without the element of danger or loss of wheel in case of breakage.

In cases where the wheel speed is too slow, better results will be obtained on gray iron by using a slightly finer or harder wheel, the extent of the change made depending on the speed variation, between 5,000 surface feet and the speed at which the wheel spindle actually runs. There is a dragging action which wears away the wheel when a hard, brittle material is being ground under a slow wheel speed condition.

In grading cup or cylinder wheels, when they are to be used for rough work and hand grinding, no trouble will be experienced with wheels of the same grit and grade as furnished in a solid wheel, providing the same allowances for speed conditions are made. The fact that much side grinding is done on solid wheels, and satisfactorily as far as grit and grade are concerned, is proof of this contention.

Snagging.

The proper grit of a snagging wheel depends, of course, upon the finish desired, although in some cases this is of little importance. It depends also upon the size of the work, which in many cases, if not always, governs the amount of stock to be removed. The size of the wheels are also to be considered, principally the width. In many cases, wheels are used, which are too wide for the work and vice versa. On large and heavy work a wheel of large diameter is economical, but on light work which requires little grinding, there is a question if, in the long run, it would prove so, due to its liability to cause trouble by running out of true. The proper sizes, therefore, also the grits and grades can many times be accurately determined by noting the size of the work and also the operation of grinding it.

Hard and Soft Spots.

Many time, complaints of hard and soft spots are due to the grading, condition of grinder, speed, size of wheel and work, and method of grinding. If a wheel runs out, it is in the majority of cases at once blamed to the wheel, and hard or soft spots cause the trouble—in the estimation of the user. It is impossible to obtain good results when the grinding machine is out of repair, not to mention the element of danger.

Naturally the thing to do is to improve conditions where required, but in some cases the customer insists that the wheels are faulty because they used to run all right. He refuses to understand wherein the trouble lies and that the grinder has changed, and not the wheels. While such cases are fortunately few, conditions can be directly improved, but not without losing in another direction what may be gained by a change of wheel grade. Even then it is almost impossible to know what change to make, as even on such work as may be termed rough, there is the element of human nature to contend with.

Complaints of soft spots may be overcome by using a softer grade of wheel, as it will wear down even and run smoothly. There is no jump as from the harder grade, caused by the latter getting out of true. Theoretically, complaints of wheels getting out of true would be more liable to come from shops where they are used on flexible shafts and compressed-air-driven portable grinders; also, when wheels are run on swing frame grinders, or when heavy work is suspended and forced against a wheel on a stationary grinder. In the last two cases, however, the vibration or chatter of the wheel against the work is greatly lessened, and in many cases entirely overcome, by the weight of the wheel and head in the first case, and the weight of the casting in the second. What change to make to overcome such a complaint depends largely upon the existing local conditions.

Provided the wheel is correctly graded for the work, under ordinary conditions, a wheel of harder grade can be substituted, as it will stay round longer, but is more difficult to true off. On the other hand, a softer wheel will begin to run quicker, but being softer it will round itself true again almost before its being out of balance is perceptible.

---

*In the "Abrasive Age."

While I have never seen a comparative test made, I believe the softer wheel would prove more economical, when the loss of the hard wheel from dressing is considered, together with loss of time in performing this dressing operation.

Wheel Breakage.

At various times, we hear of wheels breaking, and usually the wheel has to take the blame, whereas, in my opinion, in the vast majority of cases, the breakage is caused by carelessness or ignorance. Naturally, the first thing thought of is the speed, but this is only one of many causes. The crowding of the wheel on the spindle, rather than taking the equivalent length of time to scrape the hole, if this proves necessary to obtain an easy fit, is another common cause of breakage Exerting too much pressure in tightening the nut, causing a tremendous strain against the sides of wheel, especially if flanges are not relieved as they should be in every case, is another common cause. Care should always be taken to keep the work rest, if one is used, close enough to wheel so as to overcome the danger of the work getting caught. It is usually taken for granted that the bearings of machines are kept babbitted and the machines kept in good condition generally.

AN INTERESTING BOILER REPAIR.

THE twin-screw steamship "Canada," 11,440 tons, of the Austro-American line, is one of the largest vessels entering Montreal harbor during the present season. She is, moreover, one of the largest emigrant ships in the world, having accommodation for over 3,000 steerage passengers, together with a crew of 160.

The "Canada" is propelled by quadruple expansion engines fitted with Walschaert valve gear, and steam at 215 lbs. pressure is raised in four boilers of the Scotch type. Each of the latter has three furnaces, the two centre boilers being single-ended, while the port and starboard boilers are double-ended. On the ship's first voyage to Montreal from Trieste this season, she met with a mishap, which put the port boiler out of commission. She had a very light cargo on that trip, and was only drawing 13 feet forward and 21 feet aft, as against her normal draft of 30 feet when fully loaded.

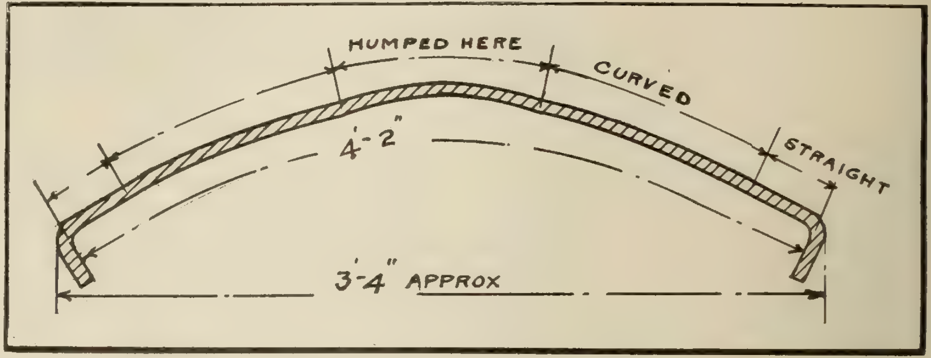

FIG. 2. AN INTERESTING BOILER REPAIR.

The incident took place in the afternoon when off the Banks of Newfoundland. The "Canada" had on board 2,300 passengers, the majority of whom were on deck at the time. A strong north-easterly wind sprang up suddenly, and as there were numerous icebergs in the vicinity, this wind was very cold, causing the passengers to make a concerted rush to the lee side of the deck houses. This movement, combined with the strong wind, gave the vessel a bad list to port, with the result that the crown sheet of the starboard combustion chamber of the port boiler became overheated and collapsed.

CROSS SECTION COMBUSTION CHAMBER

FIG. 1. AN INTERESTING BOILER REPAIR.

There were three inches of water in the glass at the time, and directly the ship listed extra feed was given to all the boilers. At the same time the starboard tanks were filled as rapidly as possible in an endeavor to bring the ship again upon an even keel. These measures took about ten minutes, by which time the crown sheet of the combustion chamber in question had been badly burned. It collapsed in pockets between the staybolts, causing the holes for the latter to become enlarged, although the bolts did not actually pull out. There was, however, a serious leakage of steam and water into the furnaces.

The ashpan and uptake dampers were immediately closed, and the fires drawn. The latter operation proved rather a difficult one owing to the escaping steam; but fortunately no one received injury.

Making the Repair.

The voyage was continued with three boilers, and on Montreal being reached, repairs to the damaged combustion chamber were at once undertaken by the Hall Engineering Works of that city.

The combustion chamber top was 4 feet 2 inches wide by 5 feet long, and it was desired to have the new crown sheet made from a single plate, but the internal diameter of the corrugated furnaces was only 3 feet 6 inches; so that at first sight there seemed to be no choice but to use two plates and have a riveted joint along the top of the chamber. Such a joint would, of course have been highly undesirable in such a location, and the manner in which the necessity for it was overcome is shown in the accompanying cuts.

The crown sheet, it should be mentioned, was ⅝ inch thick and of ordinary boiler plate quality—60,000 pounds tensile strength. It was flanged on two edges to make joint with the combustion chamber side sheets, as indicated in Fig. 1. In order to get it through the flue it was determined to roll it to a curve, as shown by Fig. 2. A piece of ⅛ inch plate was first taken and cut to the dimensions of the crown sheet. This plate was then flanged, so that it formed a true templet of the heavier plate. It was then put through a set of rolls and various trial curves given to it until it would pass easily through the flue. The curve did not extend the full width of the plate, a portion of the latter being left flat near each of the two flanges. A rather sharper radius was given along the longitudinal centre line than elsewhere, the general shape of the curve being shown in Fig. 2.

The templet having been satisfactorily shaped, the crown sheet was rolled to the same curvature. It was then transported from the Hall Engineering Works to the ship, where it easily passed through the furnace flue into the combustion chamber.

The next step was to raise the plate and place it upon the top of the forward tube sheet with the flanged edges in a fore and aft direction—that is, in a position at right angles to the direction they were to eventually occupy. This is shown in Fig. 3.

Straightening the Plate.

The plate having been got into the position indicated, stout timber struts were fitted between it and the boiler shell. These served to hold it securely while one half was gradually straightened out by hydraulic jacks. When this had been satisfactorily accomplished the plate was removed to a similar position on top of the other tube sheet, and the straightening operation repeated on the other half. The plate was practically straightened cold, it only having had "the chill taken off," in order to avoid the risk of setting up serious stresses in the metal.

All that now remained to do was to turn the plate round into its final position and drill it for the rivet and stay bolt holes. The rivets were then driven, the girder stays replaced, and, in just a week's time from the commencement of the job, the boiler was ready for steam again. Of course, work was carried on night and day; but, even so, the performance was a good one. Turning the plate around and afterwards straightening it were two very awkward operations in the cramped quarters afforded by the combustion chamber; and that the work was satisfactorily accomplished speaks well for the facilities to be found at the port of Montreal, and the resourcefulness displayed by and emergency equipment available at the Hall Engineering Works there.

HOW AND WHY IN THE MACHINE SHOP.

DURING my visits to engineering firms, says "Kontor" in Page's Weekly, I have been forcibly struck with the enormous quantity of machines to be seen in works engaged in the mass manufacture of specialities, which have been produced in their own works. Upon demanding the reason for such procedure, the information has been tendered that the usual commercial machines had been found either entirely unsuitable or lacking in quality, power, or stability. In few instances was price the determining factor, for it was realized in the majority of cases that home-made machines made in small quantities must necessarily cost more than standard productions bought from specialists. It is true that at times home production has been instituted where change in design has been desired, but only after refusals on the part of manufacturers to make the desired modification, or the cital of an exorbitant figure.

Call for Modifications.

While it is oftentimes a fact that firms call for modifications to meet mere personal fads, it is also true that others base their demands upon actual practical experience sufficiently prolonged as to exhibit the inherent defects of machines already in use. A case in point is that of a large firm engaged in the manufacture of goods in which press work predominates. Initially presses of various standard makes were installed —both British and American. In use certain defects revealed themselves and as a rule, the British machines suffered by reason of unwieldiness, unhandiness, and inaccuracy; the American on the counts of lack of durability, lightness of structure, and liability to frequent breakdowns.

The facility for adjustment of tools and work, and general handiness resulted in the eventual adoption of American machines, notwithstanding the fact that by reason of greater stability the British machine had a greater yield so far as total output was concerned. Accuracy of output here was the determining factor, although the saving in toolmakers' time in making adjustments was not a minor consideration.

A Combination Unit.

As productive demands grew, it became more and more a necessity to reduce troubles and expense consequent on breakdowns. Hence steps were taken to produce an experimental machine incorporating all the knowledge gained by a long experience. A machine was eventually evolved combining the stability of the British machines with the handiness of the American. Sliding surfaces were increased, the diameter of journals enlarged, and quality of materials chosen to give the improvements in strength shown to be necessary.

Under test, this machine gave unlooked for results, the speed of production being increased by nearly 50 per cent., and the annual output, by reason of freedom from "hold-ups," due to breakdown, increased some 75 per cent. Power requirements, relative to output, had also decreased. A batch of machines was put in hand, incorporating slight improvements such as were suggested in the testing of the first machine. These machines were subjected to systematic observation and in a subsequent batch still further improvements, with corresponding increase in output, were made. The same procedure has been followed up, with the result that the annual output over the original machines has gone up some 300 per cent., and the repair and power bills relative to output have decreased considerably.

Decreased Vibration Feature.

Press makers will be interested to learn that the main cause of increase in output was due to features which decreased vibration. For instance, the base supporting the die was eventually made absolutely solid instead of hollow, as is the common practice. The value of increased weight here was realized only by degrees. At each improvement the metal in the base had been thickened up until only in the last batch was solidity reached. The different batches are running in rows, side by side, and the witness cannot fail to remark the difference, for the last machines installed are silence itself, compared even with those of the previous batch, although the speed is greater.

The Specialty Handicap.

Meantime, makers of standard presses are in practically the same place they were in the beginning. In many instances, even improvements are regarded as impossible. One reason for this tenue on their part is that they so very rarely have an opportunity of subjecting their machines to an extended test, for press manufacture demands little or no press work. They would, indeed, be better capable of delivering judgment on other classes of machinery, the machines used in the production of presses. This is a dictum applicable generally to manufacturers of machines outside those which are classed as machine tools proper.

A Remedy in Effect.

How can this condition of things be improved? A reply is forthcoming in the policy of certain American firms, the Norton Grinder people, for instance, who advertise "grinders and grinding." Without any doubt, the experience gained on outside work thus undertaken is conducive to improvement in their production proper—grinding machines.

An argument which might be presented against this procedure is that it would be impolitic for a firm to compete against its own customers, but is the argument, all things considered, a legitimate one? No firm who has already adopted grinding methods, would consider for one moment the policy of putting out work, except under "rush" conditions. Firms who however, have not yet been induced to instal grinding machines, are at times compelled to get a certain amount of grinding done.

The grinder maker who caters for outside work would naturally be resorted to in such cases, particularly as his prices are likely to be reasonable, owing to the two interests involved. In the event of the firm whose work has been undertaken, deciding finally to save the profit paid to the grinder-maker, the chances are that the latter, by reason of experience on the actual work, will be able to give guarantees which will secure for him the order for the required machine. He would, at least, have the preference.

Similarly, makers of automatic machines might be well advised to undertake the production of bolts, nuts, and small machine parts; makers of forging presses, the production of forgings and so on. This would be far preferable to the usual practice of wasting material and time in the production of scrap-heaps.

CARE OF ABRASIVE DISCS.

THERE is a right and a wrong way to take care of your stock of abrasive discs, says the Gardner Grinder, and it is for those who keep their discs improperly that these few lines are intended You keep your stock of steel castings, belting and other material in a systematic manner, and, likewise your abrasive discs deserve equal attention—possibly more so, owing to their somewhat fragile nature.

Like anything else you should have a place to keep your discs until it is required to use them. If your stock room is damp, don't store your discs there—dampness and excess moisture have a deteriorating effect on the bond, or glue. Never store your discs in a damp basement, or against steam pipes or any place where they are liable to be wet. Your cupboard for discs should be in a dry place, and, if possible, conveniently located near the wheel press and machine.

They should be stacked up flat; do not stand them on edge as this will cause them to become curved, which, on coarse grades, may result in difficulty when you come to attach them to the steel disc wheel. If when stacked up flat there is a tendency for them to "curl"—and sometimes this happens in prolonged damp weather—place a circular board on top of stack and weight it down. Discs which have always been kept dry and flat should work with complete satisfaction.

Do not bend a disc so as to "crack" it. One which has been so cracked is not ruined but it may not give full efficiency. Separate the various grades and sizes from each other. This enables you to avoid error when selecting a new disc, and you can also tell at a glance the amount of stock you have on hand at all times.

FERMENTATION OF SAWDUST.

A LARGE English company has begun the commercially successful production of acetone and fusel oil from sawdust by a simple process of fermentation. From these two products isoprene can be derived, which latter can be changed into rubber, merely by allowing it to lie in contact with a small quantity of the metal sodium. This synthetical rubber vulcanizes readily and compares favorably with the natural product in resilience, durability and price.

Acetone is used in the manufacture of cordite, and fusel oil is used in the manufacture of artificial leather cloth. Previously it was chiefly obtained as a by-product in the manufacture of whisky, brandy and vodka, but by this new process it can now be extracted much more cheaply, making possible a large profit. It is calculated that these bye-products of sawdust are worth almost $400 a ton. As it takes only ten tons of sawdust to yield a ton of these valuable constituents, the resultant profit is obvious.

In Europe, with its densely populated regions contiguous to the forests, the elimination of wood-waste is an economic essentiality, and hence methods have been evolved which, in some cases, utilize even the leaves and roots of trees. While this is not essential in America at present, it is desirable to reduce the waste which takes place in the different processes of transforming the standing timber into finished product, which amounts to something like fifty per cent. of the total volume of the tree. To this end, the Canadian Government is establishing a fully equipped Woods Products Laboratory at McGill University in charge of Mr. A. G. McIntyre, B.A., B. Sc., under whose direction experiments will be conducted to discover new uses for common Canadian trees and for the enormous quantities of sawdust and other forms of waste wood which now represent a money loss to the country of millions of dollars annually.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

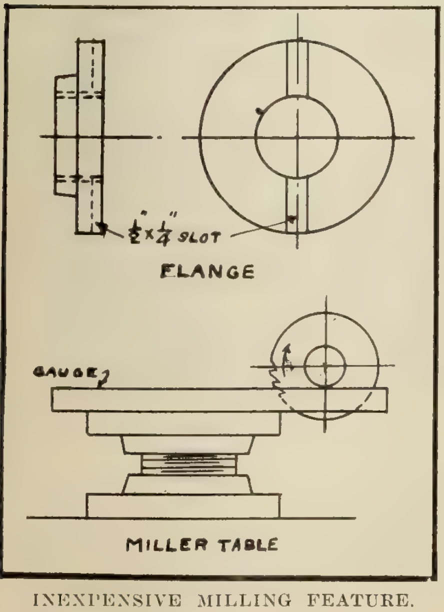
INEXPENSIVE MILLING FIXTURE.

By Don. A. Hampson.

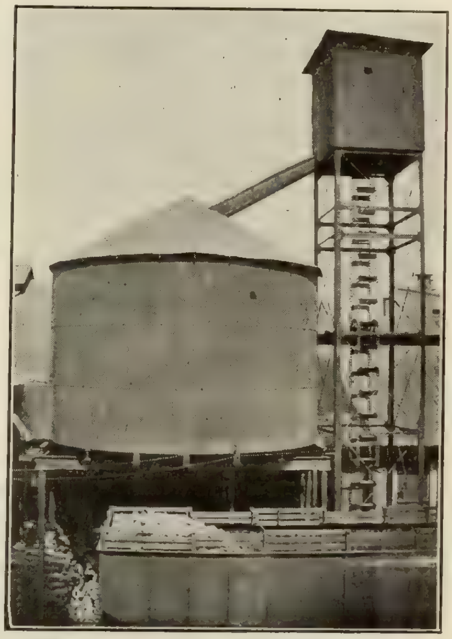
A SHOP manufacturing cast iron pipe fittings sent in a thousand 3x6 flanges to be milled—work for which they were not equipped. The flange and the slot to be milled are shown in the drawing—the slot to be diametrical with the hole and its depth within 1-100 inch of truth with the machined face, which was square with the threaded hole.

Now there are few classes of work in which manufacturing methods have been been "intensified" more than pipe fittings—competition is keen and prices are primed down to the last fraction of a cent. Any subsequent work put on such an article has, of necessity, to be in some kind of proportion to the original cost—a buyer would look askance at say ten cents worth of extra work put on a ten cent flange. We knew this, and moreover were asked to make a rock bottom figure on the job. Some sort of fixtures were, of course, required but as there would be no more of the work after this lot, they had to be of the cheapest kind. In the end, it cost only $3 to make the fixture and set up ready to mill, and, when all the flanges were finished, we had left on our hands the following items:—½ lb. of machinery steel and two 3-in. nipples 2 inches long. Just a word of explanation.

Having secured two short 3-in. nipples from a plumber, they were screwed into two of the flanges as tightly as possible. Then the flanges were put on the faceplate of the lathe and the exposed threads trued up with a tool, making them, or rather their imaginary centre line, perfectly square with the face of the flange. These flanges were bolted to the tables of two knee type millers which were situated next to one another. One boy could then run two machines.



INEXPENSIVE MILLING FEATURE.



A COKE ELEVATOR.

In setting the cutter, it was centred on the threaded nipple: this made all cuts diametrical on the flanges to be milled. To get the depth, individual measurements had to be made on each flange because some would screw on farther than others. These measurements were made as follows:—The flange having been screwed down fairly secure, it was run up to the cutter and the feed put on, then a strip of flat steel which had been made the correct width was used as a gauge between the flange being cut and a collar on the arbor.

By holding the gauge flat on the face of the flange, it could be slid along until it either touched the collar or passed under it. If the former, the table was dropped a little, and the latter, it was raised until it just touched the collar and no more. The construction of the knee type miller made it particularly adaptable to such a setting, the trick of which the boy readily acquired.

A COKE ELEVATOR.

THE accompanying cut shows a coke elevator used by a large Western iron works. The bucket chain is run by a small electric motor, and the coke is automatically dumped into the upper chute, and slides into the middle of the metal bin, where it is kept dry ready for use, and safe from the disintegration that takes place in coke exposed to the weather. The method of using this elevator is to run a car up on the siding, close to it as shown, and then two men drop the coke down a short chute, so that it will slide into the buckets as they rise. The space under the storage bin is used to store pig iron, which is elevated to the top of the furnace by means of a power operated lift.

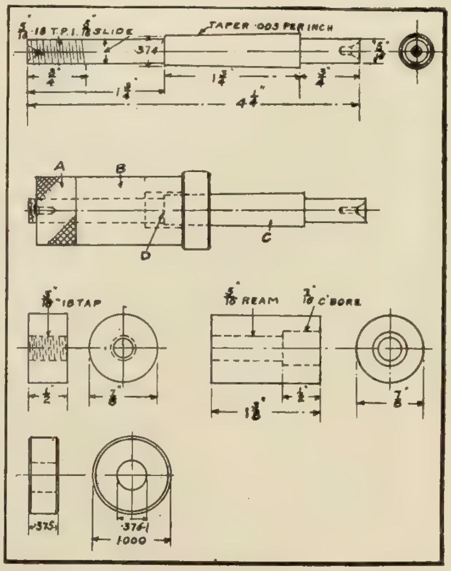
ARBOR FOR GRINDING SMALL ROLLS.

By J. Baker.

THE arbor in the accompanying illustration was designed for the purpose of holding the roll shown, while grinding the circumference. The outside surface of the rolls was required to be perfectly straight and parallel with the reamed hole in the centre, and also to be concentric with the hole. It was first tried to do the job using a straight arbor, but as it was impossible to hold the reamed hole to exact size without lapping, it proved to be a very expensive operation, and if the hole was not lapped the work was often not concentric. The



ARBOR FOR GRINDING SMALL ROLLS.

special arbor shown here overcame all the difficulties encountered in the previous methods, and proved very quick and economical in use.

The arbor consists of three parts; a knurled nut (A), a collar (B), and the arbor proper (C). By referring to the sketch, it will be seen that the reamed hole is .376 with an allowable variation of minus .001, making the smallest allowable diameter, .375. As the portion of the arbor (C), when the work is placed, is tapered, the diameter at (D) is made one thousandth less than the small diameter of the reamed hole, or .374, in order to assure the work going on the arbor. From (D) the arbor is tapered .005 per inch for a length sufficient to allow a roll with a hole the maximum size to be held, and beyond this point, is turned straight to a shoulder for attaching a dog, and has a female centre in the end to fit the grinding machine.

The other end of the arbor is turned straight and smooth to fit the hole in the collar (B) and the extreme end is threaded for the nut (A). The work is placed on the arbor, and is pushed along until it stops, when the collar is placed against it, and then the nut is tightened, holding it securely in place and against turning. As the face of the collar (B) presses against the side of the roll, it will be seen that the work is thus held perpendicular to the centre of the arbor, thus assuring the circumference being parallel in the hole. The arbor being tapered, assures concentricity. The collar (B) is counterbored to clear the end of the tapered portion of the arbor.

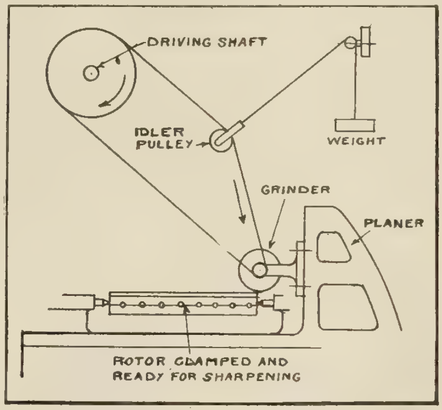
This is the best method for holding work of a like kind that the writer has yet seen.

A CRUDE GRINDING JIG THAT WORKED.

By N. G. Near.

ONE is often amazed, after building a crude machine, die, jig, or what not, to find that the creation "works." I have many times stood by and pondered over the dependability of a gasoline engine, for example, working on the hit and miss principle with noisy, loose, erratic-looking and active levers that seem to evidence surprise themselves every time they strike the notch or cam that the designer intended they should strike at the proper moment. Can it be that God guides these levers? Most machine tools, praise be, are sanely designed.

Not long ago, when in charge of a machine shop out West a gentleman came in with the rotary cutter of a woodworking planer. On the rotor were the usual two blades which were badly nicked and needed considerable grinding. I presume I could have turned out a satisfactory job by merely grinding the blades on my emery wheel and lining the edges accurately with a straight edge or surface plate, but I was in a mood to tinker, bethinking me of my large planer and planer centres on which I could quickly centre and clamp the shaft of the rotating element. I thought I saw my way clear to making a jig that would turn the trick more quickly than by the method I would ordinarily have used.



A CRUDE GRINDING JIG THAT WORKED.

So, after centring the piece carefully I bolted a small bench grinder to the planer head and then constructed a belting arrangement as shown in the figure. At the time I made the device, and while I saw the sparks flying from the wheel. I was somewhat elated and called the attention of all of my men to its success, and, of course, told the owner of the woodworking plant as well as chance visitors all about it.

Before now, however, I have several times wondered that the idlers did not kill somebody. It was the extreme of crudity, with rough iron straps and plenty of ragged edges and sharp corners to catch the belt as it passed over the idler pulley. Had the idler caught, the weight certainly would have been pulled over the beam at high velocity, and somebody would have been in serious danger.

I can now see that an idler would have been unnecessary. I could have brought the grinding wheel down to approximate grinding position, and could have laced the belt on tight. The elasticity of the belt would have given plenty of latitude for vertical adjustment of the grinder on the planer head, while the width of the pulley on the driving shaft cared for horizontal feed.

METHOD OF SPLICING PAPER AND CLOTH BELTS.

ADVERTISEMENTS relating to improved machinery are usually read with a quaking heart by a large number of workmen, says H. H. Miller, in the Abrasive Age, as many of them are apt to think that it is their scalp which is referred to in the statements that the machine will do the work of several men, and in half the time. They do not stop to think that these machines, or nearly all of them, will require men to attend to them. If some of the workmen who keep their finger nails down to the quick, pushing a sandpaper block, could see the working of a good up-to-

THE FINISHED SPLICE.

date belt sander, I believe they would welcome the opportunity to run one. In operating these machines there is much more opportunity to become a skilled man than at the bench, and the work is so much easier.

I am frequently questioned concerning the splicing of paper and cloth belts, and which method is the most generally used. In this, as in numerous other operations, there are different ways of getting practically the same result, and while shop conditions, machine makeups and finish required in a measure affect belt slicing, yet there are some operators who think that, as long as this or that method gets by, why experiment with other methods.

My experience is that the panel paper belt operators mostly use the interlocking belt-splicing dies, cut at an angle of 45 degrees and some at right angles, backing up the splices with a very light cloth. The straight, butted end splice, cut on the bias, is the favorite on high-speed machines carrying cloth belts, while on the slower speed machines, I find the operators lapping the ends, one of which has had the sand soaked off, while others lap them just as they are cut. These lapped splices are generally made at right angles.

One of the prominent chair manufacturers in Gardner, Mass., has, in my opinion, the best method for splicing cloth belts. It is a method which is extremely simple and can be carried out by a fifteen-year-old boy. By this method belts are produced that neither jump nor pucker, that are never even found to start at the splice, and the full life of the cutting material is obtained. The method is as follows:

A 24-inch straight edge is fastened to the back of the bench, to one end of which is bolted, at an angle of 45 degrees, a 20-inch discarded planer knife, cutting edge up. To the back end of this and edge down, is bolted another knife having a wooden handle; this forms the shear. Underneath the bench is swung the roll of cloth, and this is brought up over the end, grain side down, a wooden roller keeping it from fouling the knife. After being cut, the belts are suspended from a convenient arm overhead, making them easy to handle. The ends are then butted and secured with sharp-pointed nail blocks.

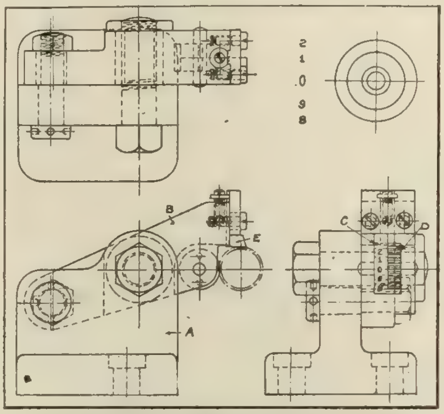
The splice is covered with moistened gummed tape one inch wide and several strips two inches wide are run across the splice lengthwise with the belt. Two dozen of the belts are made up at a time, and the whole batch is put in a home-made hand press. At the end of twenty minutes they are taken out and hung up for an hour to dry, after which they are ready for use. The neatness and despatch with which these belts are turned out is well worth the trouble and small outlay required.

◆

ROLLING NUMBERS ON NUMBER WHEELS.

By A. M. Rochester.

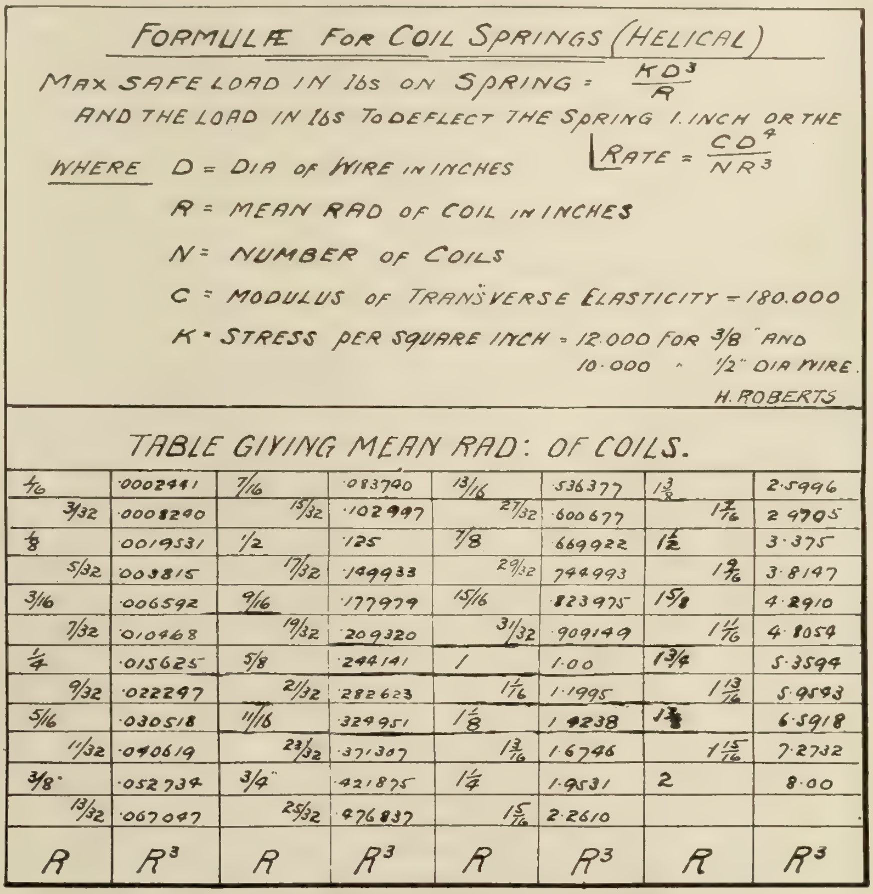
In adding machines and cash registers, there are a number of wheels used in the mechanism, having a series of figures around the circumference, usually running from 0 to 9, and to stamp these numbers on the wheels is a problem requiring much thought as to the best method to be adopted. When rolling them, it is usually hard to make the stock and the master wheel register correctly for more than one turn. If they do not revolve at exactly the same rate, the figures on the master wheel will not engage on the next turn with the depressions on the stroke, and therefore, cause a poor job. It is usually necessary to revolve the master wheel against the stock several turns in order to have the impression deep enough so that they show up well.



ROLLING NUMBERS ON NUMBER WHEELS.

In one shop, where these wheels are manufactured, we use the fixture shown herewith, in connection with the screw machine. The stock is fed out for the turret operations of drilling and reaming the centre hole, and is formed by the rear slide tool. On the front slide is mounted a regular circular tool holder (A), to which is mounted a carrier (B). To the latter is attached a master wheel (C), which rolls the letters or figures on the stock, and doweled to this wheel is a knurl (D). The purpose of this knurl is to engage the stock and keep it from slipping as it revolves, so that the master wheel is sure to follow the marks made by the first revolution. On top of the carrier (B) is mounted a shaving tool (E), which shaves off the marks made by the knurl before the piece is engaged by the master tool.

This is a most simple and economical method of producing such wheels.



FORMULÆ FOR COIL SPRINGS (HELICAL)

MAX SAFE LOAD IN lbs ON SPRING = $\frac{KD^3}{R}$

AND THE LOAD IN lbs TO DEFLECT THE SPRING 1 INCH OR THE RATE = $\frac{CD^4}{NR^3}$

WHERE D = DIA OF WIRE IN INCHES

R = MEAN RAD OF COIL IN INCHES

N = NUMBER OF COILS

C = MODULUS OF TRANSVERSE ELASTICITY = 180.000

K = STRESS PER SQUARE INCH = 12.000 FOR 3/8" AND

10.000 " 1/2" DIA WIRE.

DATA RELATIVE TO COIL SPRINGS.

DRILL PRESS ACCIDENTS AND PREVENTION SUGGESTIONS.

W. H. DOOLITTLE, Safety Inspector, National Metal Trades Association, writing in the columns of "The Review," deals with drill press accidents, and makes a number of suggestions relative to the prevention of the latter.

To the Designer and Builder.

It was a wise man who said: "We must build machinery for fools to use." Put yourself in the place of the operator. He is often a green boy who never saw a drill press before the day he came into the shop and was set to work drilling holes. Don't leave gears exposed for him to mutilate his fingers with. If the machine is driven by a heavy belt, running onto a pulley near the floor, design a guard or screen to go with the machine and prevent his clothing from being caught.

If it is a swift running, sensitive drill it will be a humane act for you to design and put on a cover which will prevent the operator's hair from being wound up by the spindle.

To the Purchasing Agent.

Every new machine which comes into the shop is admitted by your orders. It is your prerogative to prevent unguarded machines from entering the plant. Each order for a machine tool should contain specifications as to its thorough safeguarding. Every manufacturer will furnish guards with machines if they are required.

To the Foreman.

You are a practical man and probably were a drill press operator long before you became a foreman. You are acquainted with the dangers of drill press operation. It is incumbent upon you more than any other person to prevent the operator from performing his work in a dangerous manner.

One of your important duties is to prevent those in your charge from being injured. Take time to instruct the new operator. Be sure that he understands how to safely operate and care for his machine. Keep safe operation constantly uppermost in your mind. Don't allow fooling or horse play in your department.

To the Operator.

It is necessary for you to know and to remember that you may be injured in connection with your work if you are careless and inattentive. If the job is a large one, stop the machine before putting it in position or your clothing may be caught by the drill. Use sharp drills; dull tools cause undue friction After placing the job on the table of the drill press and lining it up with the drill be sure to secure it to the table so that it may not be whirled in case the drill sticks in the work. Tighten the clamp bolts of the table and of the swinging arm before you start to drill.

You should on no account use your fingers or a piece of waste to remove chips from the drill while it is running. Better use a brush or a stick for this purpose. If the nature of the work requires the wearing of gloves they should be of leather and kept in good repair. Gloves made of textile fabrics are dangerous, also leather gloves that have become ragged.

If the drill breaks in the work do not attempt to remove the pieces with a chisel without first annealing the broken parts. Operators have lost their eyesight in this manner.. When the point of the drill comes through the work, there is a tendency on the part of the drill to "hog" into the work and an accident may occur if caution is not used. The "hogging" is caused by the back lash or end play in the spindle, and the decrease in the area of the surface being acted on by the cutting edges of the drill.

It is very risky to get your head near to the drill when it is running. The drill may catch your hair and tear off part of your scalp. Female operatives have been frightfully injured in this way. Another reason for keeping your head away from the drill is that, if it breaks a piece of it may enter your eye and destroy its sight.

If the drill catches and whirls the work do not attempt to stop it with your hands but get out of line and throw the belt shipper or switch over as soon as possible.. Do not insert the drift in the spindle slot in order to remove the drill until the machine has come to a full stop. Never, under any circumstances, wipe or clean the machine when it is in motion.

DATA RELATIVE TO COIL SPRINGS.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

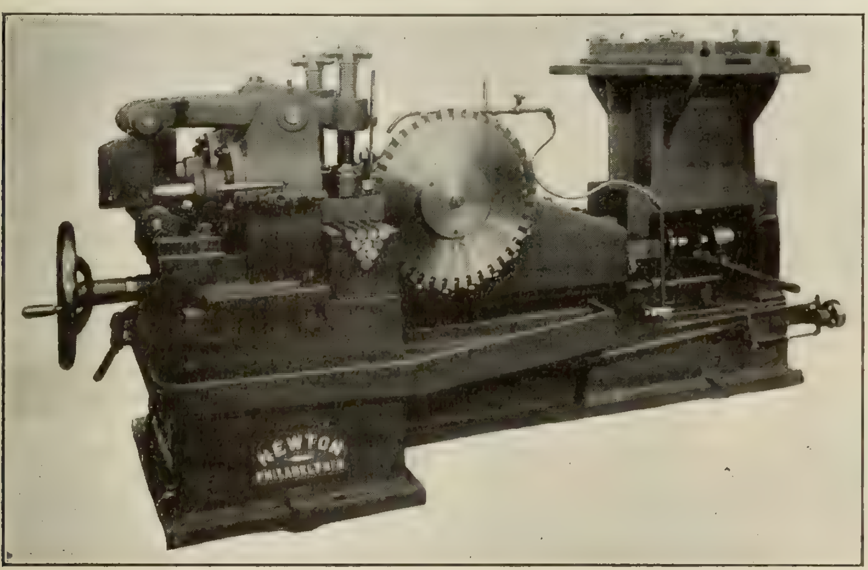
COLD METAL SAWING MACHINES.

THE accompanying photographs show the modern equipment of cold metal sawing machines furnished to fill requirements for sawing off 900 pieces of 1⅜ inch special heat treated stock in 10 hours, the machines being driven by a General Electric Co. motor, and fitted with air operated clamps and stock trolley to reduce resetting time.

Each machine carries a 26 inch Taylor-Newbold new type inserted tooth saw blade, and is fitted with pump, piping and attachments to insure ample flow of cooling fluids. The tee slots for holding the air clamps are placed at right angles to the direction of travel of the spindle saddle, and the work table, shears, extension of the base supporting the driving and feed mechanism, and the oil pan are solid castings. The spindle is of large diameter, revolving in bushed capped bearings at each end, and the parts throughout are of alloy steel and bronze, with the exception of the hand wheel and a few levers, which are of malleable iron.

To maintain rigidity, the saddle has underlocking gibs, cast solid, and vertical and horizontal fits maintained by taper shoes. The feed screw has a bearing at each end to insure its operating in tension, and the feed changes are obtained through a gear box giving changes without removal of gears. The machine is, properly speaking, in the milling class, and, for this reason, the chief consideration in design and construction was the elimination of chatter, while insuring the maximum output of which the modern inserted tooth blades are possible.

The Newton Machine Tool Works, Inc., Philadelphia, are manufacturers of these equipments.



NEWTON COLD METAL SAWING MACHINE.

NEWTON COLD METAL SAWING MACHINE.

BARREL TYPE SAND BLAST MACHINE.

A SAND blast machine of the barrel type for cleaning small and medium-sized castings and doing kindred work, which embodies several features new in design, is being manufactured by the De La Vergne Machine Co., Mott Sand Blast Department, New York.

For the new device, the simplicity of which is apparent from the illustrations, is claimed great economy of air and general efficiency of operation. It is entirely self-contained and skilled labor is unnecessary in its operation. The application of the air is by only one nozzle, as may be seen. The nozzle oscillates on the line of the axis of the barrel and throws the blast and grit along a line coincident with the axis. The movement approximates the moving of a nozzle steadily back and forth by hand, the air and grit being directed at the work instead of the work being brought under the blast. By this arrangement cleaning is accomplished with one ¼-in. nozzle, and surfaces are reached which otherwise would require several nozzles.

The barrel is made of one piece of 5-16-in. steel boiler plate and built within two heavy cast-iron rings which support it and in turn are supported by four cast-iron flanged wheels on which the barrel revolves. The barrel is perforated in such a manner that it serves as a screen, the abrasive material falling through and converging in a hopper under the barrel. From the hopper it is drawn by suction through a feed hose to the nozzle and used over and over again.

In first starting the machine, after the power is connected, all that is necessary is to place grit in the hopper. The barrel is closed at the operating end by a sliding clamp door which revolves with the barrel and can be opened when the latter is at any position. About a quarter turn of a small handwheel unlocks the door which is carried on a trunnion bearing which in turn is supported by a bracket on the case.

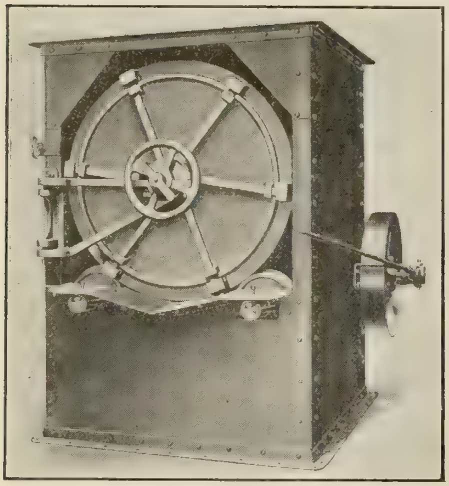
Constructional Features.

The case is constructed of 3-16 in. steel plates riveted at the corners to a 2½-in. extra heavy angle iron which is carried around the top and bottom. At the work end of the barrel is a shelf which enables the cleaned castings to be raked from the barrel into a wheel-barrow.

The flanged wheels supporting the barrel are keyed to 2-in. shafts which run in boxes attached to and outside of the case and which are driven by wide-faced gears meshing with beveled pinions as shown herewith. The shaft carrying the pinions is driven by a jaw-clutch pulley 24 in. in diameter with a 3-in. face. The speed of the pulley should be 24 r.p.m., giving a speed of 2 r.p.m. to the barrel. Owing to the slow speed, it is pointed out that delicate castings with sharp corners are not injured, as the revolving of the barrel is solely for the purpose of presenting all sides of the stock to the blast.

The oscillation of the blast nozzle is obtained from an eccentric keyed to the driving shaft. The oscillating feature is interesting in its operation as well as important from the viewpoint of economical use of air. The feed is accessible as may be seen from the rear view of the machine.

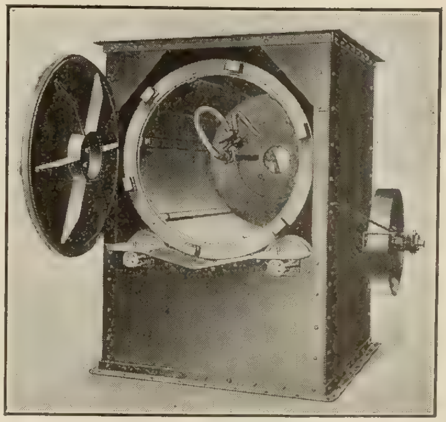
A 6-in. hole to which may be attached a pipe running to an exhaust fan is located near the top of the back of the case. Where an exhaust fan is used, the dust can be discharged in the outer air, through a chimney or otherwise.



FRONT, MOTT SAND BLAST MACHINE.

The operation of the mechanism is controlled from the work side of the machine by one lever for opening the air valve and another for operating the jaw-clutch pulley. The pulley can be placed at either end of the drive shaft to suit convenience, though it usually is placed at the right-hand side. All of the bearings of the machine are outside of the case and protected from dust and grit.

In its own plant the manufacturer has cleaned phosphor bronze crankshaft boxes weighing 60 lb. each, although the machine is not recommended for such large work. Under tests, there also have been cleaned drop forged steel hooks for galvanizing, and the results were pronounced very satisfactory by the platers. The use of angular grit is recommended. The machine in tests conducted by the makers has thoroughly cleaned cored brass castings in 200-lb. lots in 3 min., grey iron in 4 to 8 min., and removed the scale from malleable tees in from 10 to 15 min. It has operated successfully on brass castings at 40-lb. pressure, the manufacturers assert, but about 80 lb. is advocated, as better results are then assured.



INTERIOR, MOTT SAND BLAST MACHINE.

The use of long nozzles is advised, as the sand then impinges with greater force on the work and consequently the cleaning is done more rapidly. With bulky pieces, however, short nozzles may be used, thus giving greater clearance between the shell of the barrel and the end of the nozzle. Several nozzles, which are the only part of the machine to wear out, are supplied with it and they can be readily made by any foundryman.

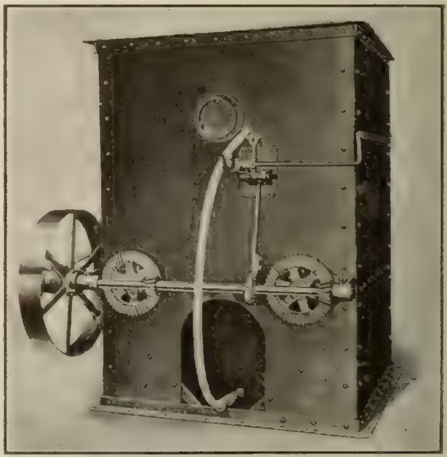
DUPLEX CAR BOX BORING MACHINE.

THE Detrick & Harvey Machine Co., Baltimore, Md., have recently put on the market a machine built particularly for boring car journal boxes, but also capable of being used for other machine work of a similar nature. Some idea of the general design of the machine may be obtained from the accompanying illustration. It is substantially a double unit. The motor, which is fixed on a bracket, and forms a contained feature of the machine, drives two parallel spindles through gearing, each spindle in turn driving a boring bar, one on each side of the machine. A pair of the parts to be machined are placed in a pair of jaws on opposite sides of each boring bar, so that four boxes are machined at one time. The machine is, in a word, a production of relatively special application, capable as a result of a high production, particularly where numerous articles of the same general type have to be finished.

As regards the machine in general, it may be noted that the bed is of the double shear type, 45¾ in. in width over all, and 12⅝ in. deep, supported on two pedestals. The centre of the spindle bearings is 13 in. above the top of the shears, and the spindles are of cast iron, 4¼ in. in diameter, with 17 in. bearing in the headstock. The socket into which the boring bar is fixed is attached to a sleeve, and the sleeve is engaged or disengaged with the spindle by means of a sliding tooth steel clutch, the lever for which may be seen immediately above the head-stock.

The carriages have a sliding motion on the shears of the machine bed and may be operated by hand or power. There is a quick hand motion by means of the spider working on a rack, a hand wheel on the end of the lead screw, and power action by the spur gearing at the end of the bed, as stated. The little hand wheel shown operates a right and left hand screw for clamping the work in place, and the work is further held in the jaws by means of a hinge bolt spanning the space across the top of the jaws.

The feed screws are 1¾ in. diameter, and provision is made for protecting both the screws and the nuts from chips, by covers. As the motion to the feed mechanism is taken from the spindle, the feed of one-half the machine is in action only when the corresponding spindle revolves. A 12½ h.p. motor is ordinarily installed, with a speed variation of 1 to 2, giving spindle speeds of 25 to 50 r.p.m. and feeds to the carriage of 1-16, ⅛ and 3-16 in. per revolution of the spindle.

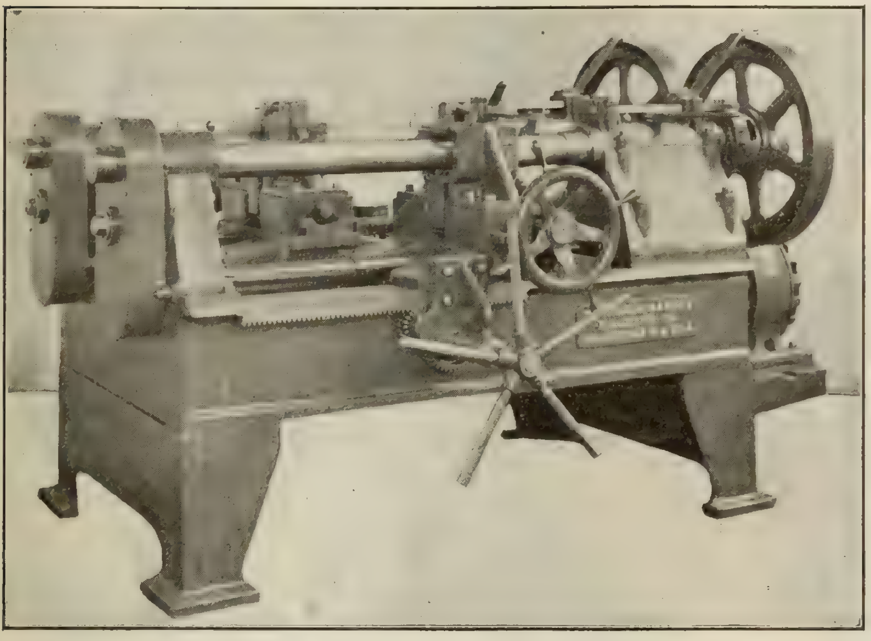


REAR, MOTT SAND BLAST MACHINE.

There are three cutters wedged in each

boring bar, one about the centre, which is provided to do the main work of boring; one toward the headstock of the machine, which cuts on a large radius out of the end of the boxes, and a third toward the opposite end of the bar, which cuts a small radius at the other end of the bored out surfaces. The boring bar has no longitudinal movement, but is secured to the end of the driving spindle in a socket, and at the far end runs in a bearing in what corresponds to a tailstock. In this are some change spur gears, which are made to revolve a lead screw extending along the machine underneath each carriage.

The carriage carries a split nut, which is made to close around the lead screw by means of a lever, and the carriage with the car boxes clamped in jaws is placed toward the headstock. After being bored by the middle cutter, the boxes are fed up to the cutter which cuts the large radius, the nut is then disengaged, and the boxes are fed by hand by means of the spider shown to the rear cutter, which finishes the operation as stated. The boring bars are of steel, 3 11-16 in. in diameter, for use in boring boxes 5 in. and larger in diameter, and the machine is designed to finish all sizes of boxes up to and including the 6 x 11 in. M. C. B. standard car box.



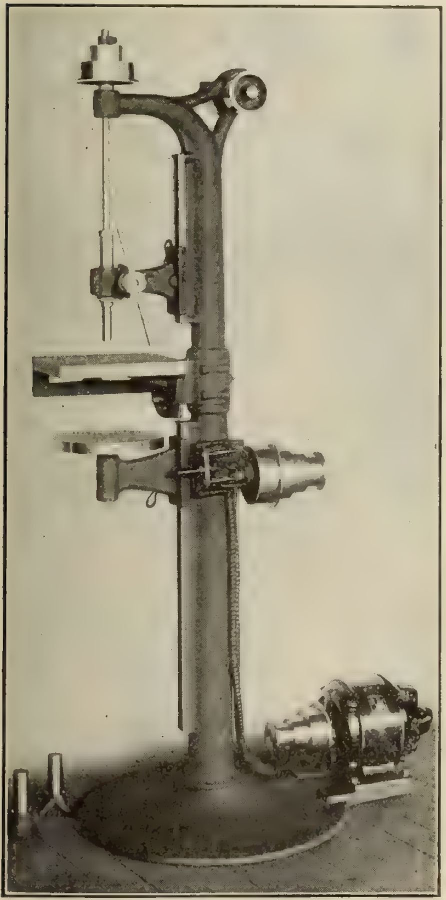
DETRICK & HARVEY 1913 MODEL DUPLEX CAR BOX BORING MACHINE.

◆

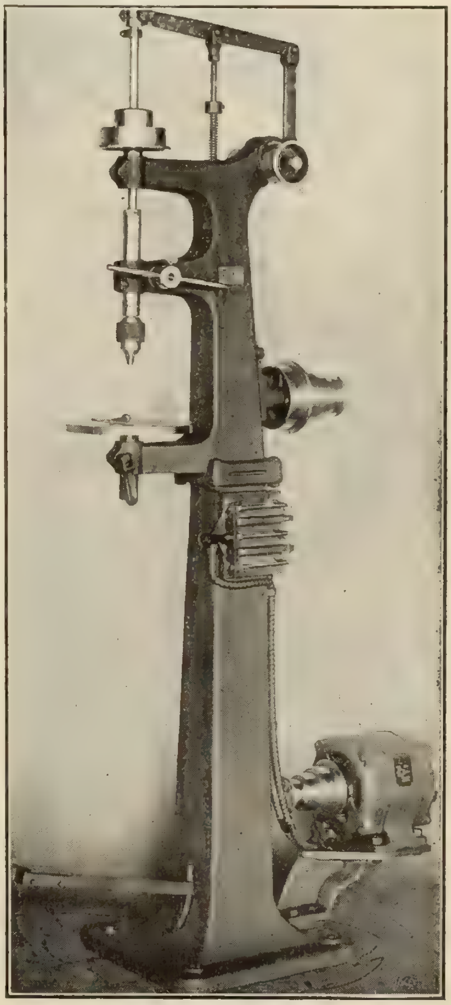
MOTOR-DRIVEN DRILLS.

THE two drills shown in the illustrations are modernized designs of machines that have been on the market for many years. Motor drive is one of their conspicuous features. The addition of the motor makes the drill an independent unit, which can be installed wherever desired without reference to line shafts. The motor is stopped and started by a switch convenient to the operator. Each drill has six speeds obtained through cone pulleys, giving a range of from 600 to 2,400 r.p.m. The spindle has a ball thrust bearing.

The drills are made by the Francis Reed Co., Worcester, Mass., and are driven by Westinghouse motors.



MOTOR DRIVEN DRILL.



MOTOR DRIVEN DRILL.

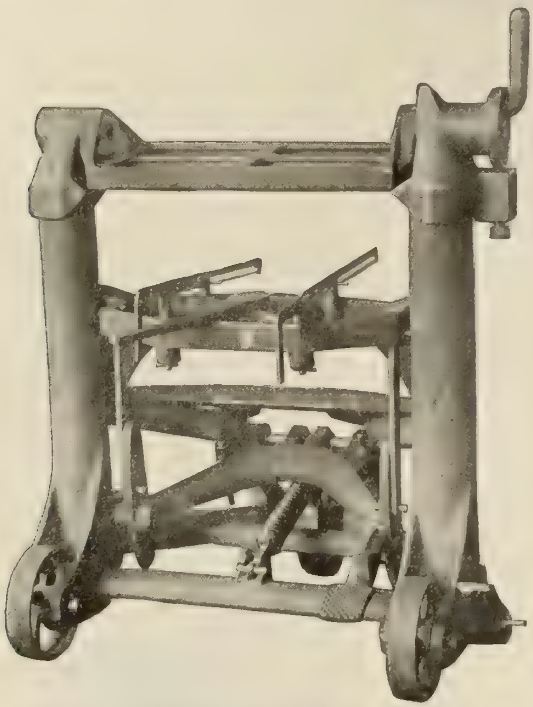
ROLL-OVER TYPE MOLDING MACHINE.

THE Osborn Mfg. Co., Cleveland, Ohio, have placed on the market a new type molding machine, known as the Osborn "Little Wonder," and which is being shown for the first time at the American Foundrymen's Convention and Exhibition during the present week. The flask or core-box can be filled, rammed rolled over, the mold drawn down and brought out clear, all without the operator once having to leave his position in front of the machine. During the whole operation there are no stops or locks to bother with. Rolling over the mold requires the least possible effort, as it revolves upon its own centre of gravity, and as most of the weight is slightly above this centre, it helps to carry the mold over, but does not bring it down with a jolt, as the cam brings it accurately to a stop at the right position. A screw shown in the illustration provides an adjustable contact point against the cam, so that the desired pressure can be secured. The mold or core is rammed by hand or foot-power, or by both.

A slight pressure of the foot brings the mold receiving table up into position. The Osborn four-pin leveling device adjusts itself to any unevenness of the bottom board, and all four pins are locked simultaneously by pushing the lever a few inches to one side. Pressing the foot treadle a second time lowers the table and brings the core or mold clear of the core-box or pattern. It is then pulled forward clear of the machine by the sliding arms, which pass through slots in the leveling pins.



OSBORN NEW ROLL-OVER TYPE MOLDING MACHINE.

General practice has shown that most core boxes can be sufficiently rammed by two or three jolts. It is also true that the ramming of many small molds can be greatly expedited by this same operation. To take advantage of this opportunity for lowering the cost of production, a special foot treadle has been provided at the side of the machine, whereby the jolting operation is performed. This is a rapid operation, requires but little effort, and the workman does not move from his position.

This machine is made in three sizes, each with 8-inch pattern draw.

No. 45—22 inches between trunnions.

No. 46—28 inches between trunnions.

No. 47—36 inches between trunnions.

Nos. 46 and 47, in addition to the regular 8-inch draw, are so designed that the pattern plate can be rocked out—thus securing additional draw if needed.

AIR SQUEEZER MOLDING MACHINE.

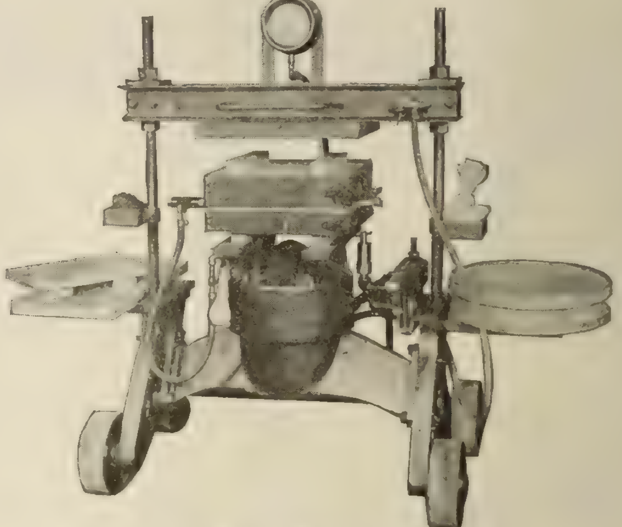
THE Osborn air squeezer molding machine is designed to permit the free shovelling of sand beneath it. This unit is equipped with a valve which provides more or less automatic operation, and which can be adjusted to any desired pressure from 30 to 100 pounds per sq. inch. As soon as the desired compression is reached, the valve not only prevents additional pressure, but signals the operator, by the hiss of escaping air, that the mold is finished. He then removes his hand from the valve, and the machine automatically returns to its off position.

This valve regulator makes it unnecessary for the molder to watch the gauge to see when the right pressure is reached. After a mold is squeezed with the desired pressure, duplicate molds can be made of similar hardness by setting the valve at this figure. Speed can be readily controlled by the operator increasing or decreasing the amount of air.

Another advantage of the machine is that none of the working parts are at any time exposed to dust or dirt, the table being provided with a shield or apron, which comes down around the cylinder to a distance which is greater than the length of the ordinary stroke. The construction is simple, strong and substantial; an illustration of the way in which maximum strength is gained without unnecessary weight being seen in the strain-rods which are made of nickel steel. Furthermore. these rods are direct-connected to the cylinder casting, thus eliminating all tendency to spring the machine when in operation.

The handy character of the machine is increased by its convenient wheed-base and its equipment bracket, sponge pocket and parting-bag pocket. The machine is built in three sizes with 10, 13 and 16 in. cylinders and 32, 36 and 42 in. between rods. The largest size is built without a wheel base.

The Osborn Mfg. Co., Cleveland, Ohio, are the builders of this specialty.



OSBORN NEW PORTABLE PNEUMATIC SQUEEZER MACHINE

LIFTING HEAVY FINISHED CASTINGS.

IN lifting heavy finished castings, the edges are frequently damaged by indentation from the slipping of the chain slings, while if rope slings are used instead, these are soon destroyed by the sharp edges of the castings. A protector has now been designed by the Hess Steel Castings Co., Bridgeton, New Jersey. The protector is a casting consisting of two plate members at right angles to one another and a pair of stiffening ribs. The chain or rope rests between these ribs, between which the casting is thickened and rounded to give a good seat and prevent damage to the sling. The ribs are carried far enough back to receive a cotter pin, which ensures the protector always being in the sling when wanted. Provision is made against damage to a sharp edge on a finished casting or machine by running a groove lengthwise of the protector at the junction of the two plates.

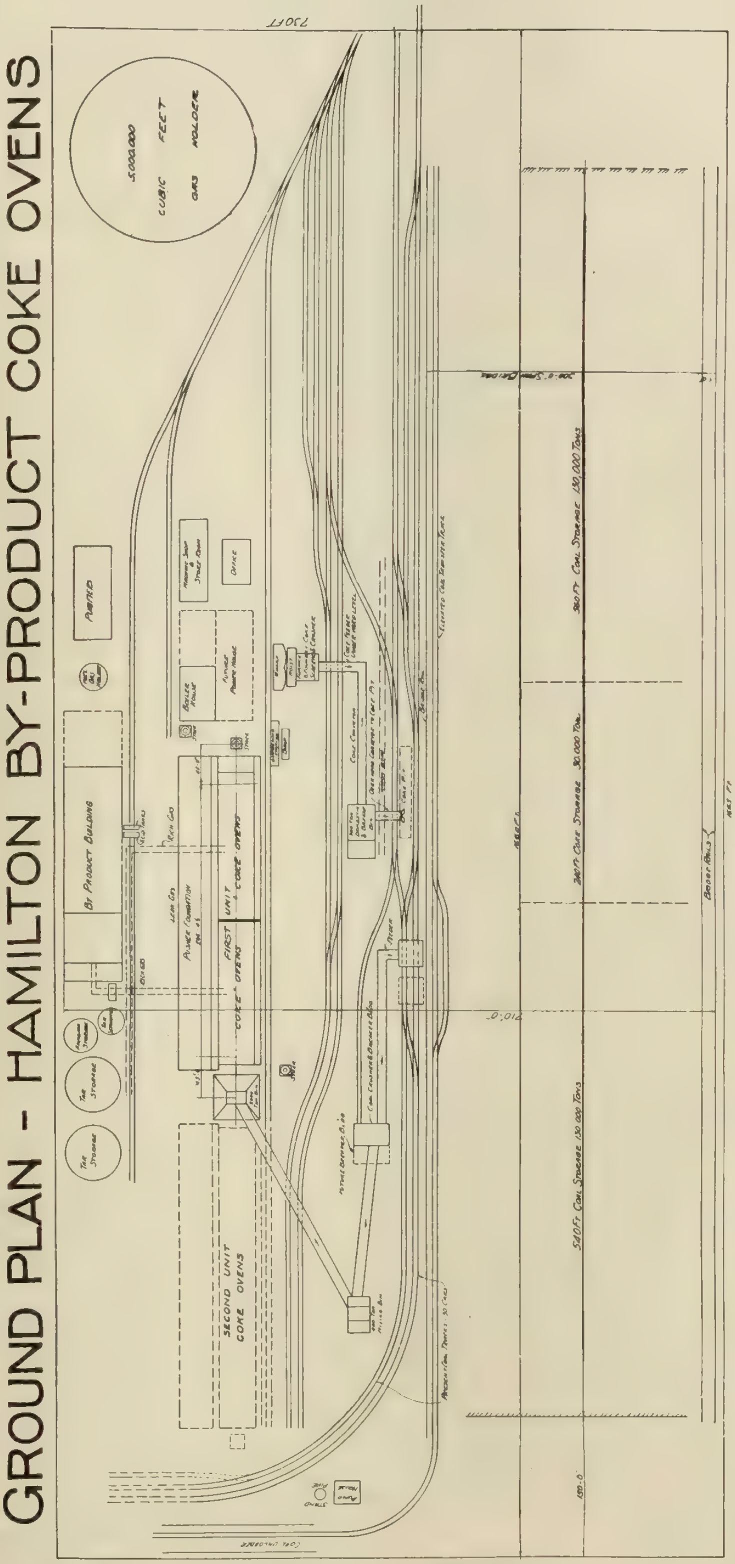
The protectors are made of a low-carbon alloy, practically pure wrought iron. This being ductile, is counted on to eliminate the danger of the protectors being broken by even rough handling. Where very great delicacy in handling is called for, protectors with a babbitt or lead lining are furnished.

HAMILTON GETS $1,000,000 INDUSTRY.

THE Hamilton By-Product Coke Ovens, Limited, capitalized at $1,000,000, has just been incorporated. While considerable local capital will be invested in this enterprise, the majority of the stock will be held by United States capitalists. P. V. Burns, of the Ontario Pipe Line Co., and John G. Gauld, of Nesbit, Gauld & Langs, are two of the local men interested.

The company will manufacture coke for smelting, foundry, minor industrial and domestic uses, and will provide a permanent supply of gas for manufacturing and domestic use. The plant will give employment to about three hundred men, and the allied companies that will be formed to utilize the by-products, tar, ammonia sulphates and benzol, will also employ a large number of men. The initial investment in plant and land will be $1,500,000, and the first unit will consist of 50 ovens, each of 16 tons capacity, operating 18 hours coking time. There will also be erected by-product apparatus for gas separation, coal preparing plant, power compressing and water pumping plant, etc., and a 5,000,000 cubic feet gas holder.

The plant will be electrically equipped and will use between 700 and 1,000 horse-power per day. It will carbonize 1,000 tons of coal per day for 365 days in the year, which will produce about 700 tons of coke per day. The company will keep a six months supply of coking coal, which will be imported from Pennsylvania or West Virginia on hand at all times, thus safeguarding the consumers of gas and coke against the annual shortages caused by railroad blockages and strikes at the mines. This coal will at present be brought in by rail, and on the completion of the new Welland Canal and the Hamilton Harbor improvements will be brought in by water.



GROUND PLAN - HAMILTON BY-PRODUCT COKE OVENS

LARGE BORING AND TURNING MILL CONTRACT.

A CONTRACT has been placed by the United States Navy Department for a 36 ft. boring and turning mill, for use at the Brooklyn Navy Yard, which will be the largest machine of its kind ever built in the United States, and will be used for machining the tracks for warship turrets. The table of the mill will be driven by a gear which is 28 ft. in diameter, the spindle will be 30 in. in diameter, and the facts of the cross rail and the uprights will measure 4 ft. and 2 ft. respectively. The bed will be 25 ft. wide, the over-all height of the mill will be 27 ft., and the total weight will exceed 600,000 lb. A 75 horse-power motor will be used to drive the machine.

NEW GOVERNMENT STEAMER FOR ST. LAWRENCE SERVICE.

THE Department of Marine and Fisheries has let a contract to the Polson Iron Works of Toronto for the construction of a steamer to be used on the St. Lawrence River above Montreal, and on Lake Ontario, in the lighthouse service. The contract price is $173,399. This is the first ship let under the new condition, namely, that construction must take place in Canada.

EFFICIENCY, ITS USE AND ABUSE.

IN the course of a recent address by Mr. M. W. Mix, president of the Dodge Mfg. Co., Mishawaka, Ind., before the Executive Club, Chicago, on the subject of "Efficiency, Its Use and Abuse," it was pointed out that no efficiency work was ever successful that did not earn for itself the approval and satisfaction of the worker; or, in other words, his spiritual co-operation must be secured. We don't work well under any system if we have the strain of machine methods in our minds, yet in our very capacities as executives we may be endeavoring to press that yoke on those under our supervision without a thought that the same sentiments and feelings that control our disposition to work also exist in the minds of those associated with us.

The Comradeship Feature.

We talk about "mixing." Has it ever occurred to you that the same glad hand and smile and consideration to our fellow-workers may seem more to us and to those receiving them than the same evidence of good fellowship which we may effusively give to a customer, or to some from whom we may expect to benefit through a business transaction? If we seek to influence a business deal with "good mixing," why not go further and give some of it to our associates that we are with every day and who work with us shoulder to shoulder, for better or worse? They want it; they like it. You liked it when you were in their places, and you responded to it or you would not be where you are to-day.

If you worked for a man or firm who didn't give you that cheer and comfort of a certain comradeship, the chances are you quit the job and found a more congenial atmosphere; and under that influence the best that was in you came out, and you delivered the goods you could have delivered to your former employer if he had known how to encourage you. All effort to be effective and gratifying must be collaborative. There may be other routes to success, but they have no sign-posts pointing the way. We may get there, and we may not; in any event, it is not likely to be a pleasure, and we may travel crooked and rough roads when shorter and happier pathways are available.

Value of Sentiment.

I do not mean to be sentimental in this matter. We often find men who are apparently successful who say there is no sentiment in business; to such, I say "bosh." I wouldn't give the snap of my finger for the business or organization that does not contain some sentiment, some vestige of a human soul. No vital problems are finally and satisfactorily disposed of that do not contain some consideration of the human element, and, as for myself, I prefer not to deal with any conditions or form of organizations—social, political, or commercial — in which the dominating influence is actuated by an arterial circulation of ice water. It doesn't get anywhere. Every one who comes in contact with it gets a chill. Other connections are sought at the first opportunity where the broad human spirit does prevail. We can nearly always tell the dominating spirit that pervades an organization on the moment we come in contact with any part of it. In the right sort, everybody radiates enthusiasm, good cheer, courtesy, and consideration. There is no greater asset to any business than occupational good-will, yet it is never seen in a financial statement, and would probably be blue-penciled if it were stated and appraised, because of its intangibility. Nevetheless, it is one of the most important factors in developing a successful business.

Organized Personality.

Corporate or organized personality finds its origin in the executive, and in so far as he recognizes its value as a world or business force, his undertakings will prosper as he capitalizes it in the minds of those of the public with whom his enterprise comes in contact. The unseen, unfelt, intangible thing then becomes the real, active force that makes the wheels go around. No task is severe, no difficulty is unsurmountable, no requirement is too exacting where this spirit really prevails. We cannot buy it, we cannot produce it, except as we cultivate it within ourselves, and expand the usefulness by radiation and encouragement. The human element, therefore, becomes the most important controlling factor in operative standardization, and to just the extent to which it is recognized and developed may be measured the ultimate success of any and all efficiency undertakings.

PREVENTION OF ELECTROLYSIS.

A WRITER on electrolysis says:—Painting or otherwise coating iron with an alkali-resisting metal preservative before embedding it in concrete may serve to minimise the dangers of electrolysis, but no such coating has been found that does not prevent the formation of the bond between the concrete and iron when the concrete sets. All circuits within a building should be kept free from earths directly on a portion of the building itself. If the supply comes from a central station, the local circuits should be periodically disconnected and tested for earths and incipient defects in the insulation.

All pipe lines entering concrete buildings should, if possible, be provided with insulating joints outside the buildings. If a pipe line passes through a building and continues beyond, one or more insulating joints should be placed on both sides of the building. If the potential drop around the insulated section is 8 volts or 10 volts or more, the insulated portion should be shunted by means of a copper cable. The grounding of electric conduits to water pipes and ground plates is in general not to be recommended in the case of concrete structures.

DONT'S FOR MACHINISTS.

DON'T screw on bolts hard enough to strip threads.

Don't leave chips of emery or brass in your eyes over night.

Don't strike highly-tempered steel with a hammer.

Don't work on shafts resting on horses without blocking them.

Don't pour babbitt without wearing goggles.

Don't use your hand to throw off a belt; use a stick.

Don't use a file unless it has a handle.

Don't fail to stand toward the headstock of a lathe when filing.

Don't fail to securely fasten work under a drill before drilling it.

Don't fail to use your "Danger, Do Not Move" sign.

Don't start a job until you have everything ready to finish it.

Don't remove gear covers and other safety appliances and fail to replace them.

Don't try to work and talk to somebody at the same time.

—Safety Engineering.

PATENT REPORT.

THE following Canadian patents were recently secured through the agency of Marion & Marion, patent attorneys, Montreal and Washington, D.C.:

Nos.

150,568—Joseph Wm. Guimont, Montreal, Que.—Water heater.

150,625—Ferdinand Gareau, Montreal, Que.—Smoke consumer and forced draft apparatus.

150,626—John H. Gill, Dunedin, New Zealand —Automatic apparatus for controlling the period of artificial illumination.

150,628—Paul Girod, Ugine (Savoie), France. Process for refining liquid steel.

150,711—Dr. Rudolf Adler, Amsterdam, Holland—Process for manufacturing phosphatid-albumene compounds from fish.

150,712—Dr. Rudolf Adler, Amsterdam, Holland—Process of manufacturing an elastic rubber like material.

150,742—C. Brownlee & J. Morris, Keewatin, Ont—Grain car door.

THE MODESTY OF ENGINEERS.

IF there is any class of men who should receive special praise and recognition in the life hereafter it is the foundrymen and proprietors of machine shops. Daily they go about their business exercising care, acting honorably more or less, and outside of their shops, little is known of what these men are doing for humanity. The lawyer and the doctor do their work, and if by chance they should handle an important case, or perform a successful operation, the Press at once admits them to its columns, and gives them praise and notoriety. The engineer, to become the talk of the town, must do something unusual outside of his foundry or shop, like poor Dr. Diesel, of Germany, who disappeared at sea a few weeks ago. Up till that event, although the Diesel engine has become a household word in engineering circles, the man in the street had never heard of it, nor of its inventor.

We have had opportunity of late to observe the modesty of engineers. Having planned a series of biographical sketches of men who have succeeded in the machine business, we approached a number on the matter, and received replies to this effect: that they had done nothing worth being written up in a paper, and would wait until age crept a little farther before deciding to "rush into print." We wish to remind these men that this is a rare opportunity for them to give a helping hand to ambitious machinists striving to climb the ladder of success. What more inspiring reading is there than the biography? In the eyes of the man who runs a foundry or machine shop he himself may be a nonentity, who has achieved nothing beyond building up an engineering business. We quite realize that, and the workmen in Canadian foundries and machine shops wish to know how they managed it. By looking into the matter carefully, it will be seen that the quality of work put out by workmen will be better as a result of reading such biographies. How can a man help but do better work when he reads in Canadian Machinery that his employer started in life carrying drinking water, and that it was by observation and industry that he attained his present position?

The suggestion has been made that this series of sketches should be confined to men who are at the heads of big industries like the Steel Company of Canada, the Canadian Westinghouse Co., etc. While efforts have been made to give the secrets of success of eminent Canadian engineers, we believe there is as much romance and inspiration in the life stories of men who have built up small yet substantial foundry and machine shop businesses. We met a man the other day who is operating a moderately sized shop who, a few years ago, was a farmer, yet in a remarkable manner, launched out in the structural steel business, and is to-day well known all over Canada through the success of his products.

We wish that captains of industry would take this opportunity of telling our readers how they achieved their first or their greatest success. We were told last week how the head of one of the largest engineering concerns obtained a start. He was soliciting advertisements for a newspaper, and on his rounds opportunity presented itself. He grasped it. To-day he is a great financier. The details of the case read more like fiction than fact.

◆

PATRIOTISM VS. PROFIT.

HOW many manufacturers are there in Canada who put their country before profit? In other words, are there men in Canada who would prefer to lose a little money on a deal rather than buy outside of the Canadian market? The situation must present itself to manufacturers every day. There is one man handling American goods in Ontario who makes it a rule never to cut his prices when competing with Canadian makers, but let a foreign competitor come on the scene, and he will have the business by hook or crook. Patriotism comes first with him in this matter.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, October 13, 1913.—There is little to report to-day. Conditions remain practically unchanged from last week, though the machinery business has perhaps been rather brisker. The contracts for the equipment of the machine shop of the Atlantic Sugar Refineries, Ltd., have not yet been let, this matter having hung fire for some considerable time now. Williams & Wilson have sold some wood-working machinery to the C.P.R., and Mussens, Ltd., have secured large orders for excavators, steam shovels, etc., from the contractors for the new Welland canal.

The Canadian Vickers Co. have been kept busily engaged all week on the C.P.R. steamship "Mount Temple" which entered their dry dock on the 5th instant, after running aground off Longueuil. This firm have been rapidly perfecting their organization during the past six months and confidently expect to have their shipbuilding slip, engineering and boiler shops, etc., fully completed during the summer of 1914.

Pig Iron, Etc.

The demand from all quarters for pig continues unabated. A. C. Leslie & Co. report several good orders for English pig, and business is likely to keep good right up to the close of navigation. Prices remain practically unchanged from last week, though the figures quoted may be shaded for large quantities.

Copper is a trifle easier than last week, but this market continues dull. Unless the world demand for copper, however, shows a marked decline in the immediate future, a further considerable advance in the price seems unavoidable, since the world's visible supplies on hand at present amount to only 92,000,000 pounds, which is by far the lowest point reached during the last five years.

Toronto, Ont., Oct. 13, 1913.—The general steel and iron market is solid. There has been no agreement between the different makers in their selling prices, and as a result, mill prices of steel, both here and in the States, remain the same. Orders for small tonnage are being secured at current prices without difficulty, and large firms are being given big reductions when placing their orders several months ahead. Manufacturers have been holding off so long, hoping the price of steel would drop appreciably, that they are now compelled to buy, and local mills are feeling the effects. Of late, there has been an increased demand for reinforcing steel, contractors having decided to rush things owing to the approach of cold weather. No Toronto dealers report feeling the effect of the new American tariff bill beyond an uncertainty among their customers as to the way prices will go. In the event of foreign competition becoming severe, dealers in steel are inclined to protect their customers who place orders at current prices.

Machine Tools.

The feature of this week's market is an order placed by Ford's, the automobile makers, for over $100,000 worth of equipment for their shops in Walkerville, Ont. Up to the present, the transmissions for Ford cars have been made by another concern in Detroit, and in order to commence the manufacture of these themselves, this order has been placed. An order for about a million dollars' worth of machine tools is at present being awarded by Ford's for their plant in Detroit for the same reason. The Canadian order was distributed over a number of firms; The A. R. Williams Co., The Canadian Fairbanks-Morse Co., and H. W. Petrie, Ltd., Toronto, being among those favored. A good part of the order went to American firms who have no agencies in Canada and considerable cutting in prices took place. The tools supplied include lathes, grinders, drills, hobbing machines, presses, etc. It is reported that the new Forge Company who will start business in Chatham, Ont., will do much of the work for Ford's in connection with the manufacture of transmissions. Details concerning the plant to be erected will be found in our Industrial News' Section.

A new firm recently arrived in the Canadian market is the Diamond Manufacturing Co., of Detroit, who have purchased space in the industrial building recently erected in Walkerville, and will make stampings.

Metals.

The metal business was reported to have reached a critical position to-day. The market weakened considerably on Friday. Copper and tin are most affected. Prices, however, remain to-day much as they were last week. Business in copper wire is at a standstill, transmission people refusing to buy at 20 cents a pound.

* * *

EFFECT OF AMERICAN TARIFF.

SIR LYMAN JONES, President of the Massey-Harris Co., in an interview at Saskatoon, which city he visited recently, expressed the opinion that the provisions of the Underwood tariff bill permitting the entry of farm machinery free into the United States would have practically no effect on Canadian manufactures, and said that the American companies were so firmly established they feared no competition. Asked as to the effect if Canada were to place farm implements on the free list, he said the American plant of the Massey-Harris Co. might do a little more business.

Speaking in a general way, he said that the subject opened up the whole question of free trade, and propounded the question whether the people were prepared for direct taxation. Money, he said, seemed scarce in the West, and more than one good crop was needed to liquidate the existing indebtedness of the farmers.

STREET CAR LINE INNOVATION.

A COMPANY has just been organized in New York city to operate an entirely new kind of street car line at Great Neck, L.I. Although the cars will run on rails and will have every appearance of ordinary electric cars, they will be independent units operating without overhead wires, third rails, or central power station. The source of power is a steam turbine supplied with steam from a flash boiler, the turbine operating a hydraulic speed transmission and two oil motors connected with the two axles.

The flash boiler is situated on one side of one platform and is heated by means of either kerosene or oil gas. The turbine is placed under the body of the car. It runs at a normal speed of from 3,000 to 4,000 revolutions per minute, and is geared by means of a herringbone gear set to the hydraulic transmission gear which runs at about 600 revolutions per minute. The car is of the single-truck type, having only four wheels, and all four of these are used for driving. Power is transmitted from the oil pump to the two axles through the two oil motors. The turbine will develop over 25 brake horse-power.

* * *

NEW SYSTEM OF ELECTRIC TRACTION.

IT is reported that a new system of electric traction will be put into operation on the Norfolk and Western Railway, West Virginia, next January. Current will be supplied to the locomotives at 11,000 volts, 25 cycles, and a combination transformer and a rotating induction machine on each locomotive will convert this to 2-phase 750 volts for the motors, which will be of the normal synchronous polyphase type without commutators. There will be four motors on each locomotive, with a total continuous rating of 1,300 horse-power at fourteen miles per hour. Each motor will have windings for producing either four or eight poles, giving two synchronous speeds of twenty-eight and fourteen miles per hour respectively. The wound rotors will give, further, a synchronous speed of seven miles per hour, with cascade connection, and allow of resistance being inserted for starting and for intermediate speeds.

Two of these 130-ton locomotives will be used for each train of 3,250 tons weight. These trains carry principally coal from the Pocahontas coal-field. The motors will be geared in pairs through a jack shaft crank and eccentrics to the driving wheels, the gear ratio being 18 to 85, and the driving-wheels 62 in. in diameter. The contract provides for twenty-six such locomotives, together with track equipment, transformer, sub-stations and a 27,000 kilowatt generating plant. These polyphase motors were chosen as against single-phase commutators on account of space limitations and lower cost, and the possibility of regenerative and safer braking on the heavy down gradients.

* * *

TERMINAL PLANS AT VANCOUVER.

OFFICIALS of the Great Northern and Canadian Northern Railways were in conference quite recently, discussing the question of a union depot. No definite decision has been issued as yet. According to the city's agreement with the C.N.R., that railway was bound to build a station to cost $1,000,000. The present station of the C.N.R. on the north side of the creek is entirely inadequate for the needs of a transcontinental railway.

The Pacific Great Eastern are working on their line to Fort George, and while their terminals are at North Vancouver, it is quite probable that freight and passenger facilities will be established in Vancouver on completion of the bridge over the second narrows of Burrard Inlet, which project has just been put up to the Provincial Government as a public undertaking. From Fort George to Vancouver, the Grand Trunk Pacific will possibly obtain running rights over the P.G.E.

On the strength of a statement by Hugh Sutherland, executive agent of the C.N.R. in Winnipeg, that wherever possible in Western Canada the C.N.R. and G.T.P. were planning to erect union stations, it is quite within reason to believe that a great union station will be erected in False Creek to be used by all four roads above mentioned.

* * *

ELECTRICAL LABORATORY AND STOREHOUSE.

A GOVERNMENT-OWNED electrical laboratory and storehouse, to be used exclusively for testing and supplying material to municipal customers, has been erected on Strachan avenue, Toronto, and is now placed at the disposal of the various municipalities throughout the Province of Ontario by the Ontario Hydro-electric Commission.

The Building Feature.

The building consists of three stories and a basement, and is 110 feet long by 70 feet wide. Approximately one-third of the area is to be devoted to laboratory work, the remainder as a storehouse for the large quantities of cable, line hardware, lamps and other incidental municipal supplies. The laboratory section is subdivided into the following four departments; high tensions and general testing, standards and meters, lamps and illuminating engineering, and laboratory workshops. A wide variety of tests is conducted in the first-named department, which cover the testing of material used in the construction of both high and low tension lines.

Equipment Features.

Every necessary kind of testing machine has been installed. This includes a 300,000-volt test transformer of large capacity, especially designed to meet conditions similar to those experienced by insulators in active service. Transformer oil is also tested to insure the use of proper quality in the general transformer system. For this purpose an additional test transformer has been installed with a maximum potential of 75,000 volts. Tests, conformable with those already required by the Commission, will be carried out.

In connection with the oil-testing system, the Commission states that switch and transformer oil filters have been installed at all 110,000-volt sub-stations on the Niagara system, which can filter oil for any municipality at cost, but the municipality before shipping the oil must advise the Commission.

Standards and Meter Dept.

On the first floor of the laboratory, above the general testing rooms, is located the standards and meter department. A complete Watt-hour meter testing equipment, as well as a Blondell oscillograph, for detecting abnormal line conditions, are to be found in this department. Adjacent to the meter department is the lamp and illuminating engineering section. The Commission lays great stress on the importance that all municipalities obtain the maximum value for their consumers' lighting equipment, and every conceivable appliance obtainable is to be seen here. This places the Commission in a position to determine accurately and fairly the relative values of the different makes of incandescent lamps or other types of light sources for use.

It has been the practice of the Commission to make periodic purchases of samples of lamps in the open market. These lamps are measured for initial rating, and are subsequently tested for life performance under identical conditions, which has given the Commission a knowledge of cost per candle-power of each lamp of every make tested. A large quantity of lamps are always kept in stock by the Commission, which will be supplied at cost to municipalities using Hydro-electric power, as will be the case with all material consigned to municipalities by the Commission.

WANTS $15,000 DAMAGES.

ALLEGING wrongful dismissal, Wm. A Grocock, engineer, formerly the representative in Ontario of Edgar Allen & Co., Ltd., is suing his late employers for $15,000 damages in the Non-Jury Assize Court at Toronto. The defendant firm are tool steel and castings manufacturers, with headquarters in Sheffield, England. Plaintiff was employed by them in September, 1910, to take charge of the business in Ontario, and to work under instructions from the chief agent in Montreal. His remuneration was £1,000 per year and two and one-half per cent. commission on the turnover. The defendants had paid him a year's salary in lieu of notice. His averments include misrepresentation on the part of defendants as to the volume of business being done in Ontario prior to his connection with the firm. They told him they had a turnover of $6,000 a month.

Plaintiff testifies that he left a salary of £820 a year to join the defendant firm. He was then with the Wm. Jessop & Sons, Ltd., in Burmah, India, and was handling the same goods for which defendants wanted a man in Ontario.

ENGINEERS' TRIBUTE TO LATE JAMES ROSS.

THE executive of the Brotherhood of Locomotive Engineers, Atlantic Division, No. 581, has sent to Mr. J. K. L. Ross expressing regret at the death of Mr. James Ross, and appreciation of the course of the deceased in connection with the miners' strike some years ago. Following is a copy of the letter:

''To Mr. J. K. L. Ross:

''Dear Sir,—The engineers on the S. and L. were much surprised and deeply grieved when they heard that your father had passed away. Our deepest sympathy goes out to you in your sad bereavement. We all feel that we have lost a good and true friend. No other man we have worked for gave our men the feeling of security in their positions that he did. We always were satisfied that if we did what was right no other influence could hurt us or our families. When some of us were unfortunate enough to err in judgment and our error cost the Company quite a lot, in the usual course on railways the officials had nothing to do but severely discipline us. Your father used his own position not to discipline our men, but to give them a good man's advice, which has helped our men and also the Company which he then presided over. Acts like these are never forgotten by railway men, and there were many sincere expressions of sorrow heard when the news of his death flashed over our road.

''They have also instructed us to convey to your sorrowing mother our deepest sympathy to her in her trying hour.

''On behalf of the S. and L. Engineers, we are, sincerely yours, (Signed). D. W. Macdonald, chairman; Parker Holmes, sec.-treas.; Hugh MacPherson, chief engineer.

''Glace Bay, Cape Breton, Canada, Sept. 20, 1913.''

PORT OF MONTREAL REVENUE.

THE customs returns for the month of September, show a decrease of $84,473.60, as compared with September 1912, the receipts for the past month being $2,133,696.61 as against $2,218,170.21 for the corresponding month of last year. Customs showed a decrease during August of over $49,000, the first decrease to be recorded for the season. The September decrease would have been much worse but for the heavy payments made on the last day of the month. They amounted to considerably over $100,000.

Curiously enough, while the customs returns showed such a marked decrease the inland revenue returns for the district of Montreal showed a still greater increase, the surplus received over September last year amounting to $96,605.57. The receipts for the past month, which will be supplemented by some further small amounts from Valleyfield and elsewhere, amounted to $925,029.83, as compared with $828,424.26 for September 1912. During August the inland revenue returns decreased by nearly $38,000, so the increase for September is the more remarkable.

RAIL MANUFACTURE.

DURING the first half of this year, orders amounting to about 120,000 tons were booked in the Belgian rail industry, including 65,000 tons for South America, 25,000 tons for Holland and Dutch Colonies, 5,000 tons for Sweden, 2,000 tons for China, 13,000 tons for Norway, and about 10,000 tons for Portugal and Colonies. Some countries, such as Brazil, the Argentine, and other South American Republics, are at present on the market for large supplies of rails, but as the orders must be executed within a relatively short time, the Belgian steel works find it rather difficult to accept them because they are engaged in the manufacture of 120,000 tons of rails for the Belgian railways.

The figures for the first seven months of this year show a total of 94,353 tons of rails exported, against 100,064 tons in 1912, a decrease of 5,711 tons, the principal markets being Brazil with 22,083 tons, Holland with 17,492 tons, Norway with 7,057 tons, Spain with 5.915 tons, Egypt with 5,365 tons, and England with 3,319 tons, against 611 tons in 1912.

MONTREAL DRYDOCK TARIFF.

APPROVAL has been given by the Governor-General-in-Council of the following tariff of tolls, submitted by the Canadian Vickers, Ltd., in connection with their shipdock, the ''Duke of Connaught,'' at Montreal; such approval being subject to the condition that the regulations may be amended at any time, should the Minister of Public Works consider it necessary to do so, and that the tariff may be likewise amended should it be established, to his satisfaction, that the rates levied are excessive:

Gross Reg. Tons.	1st day.	Following days.
Up to 1,000....	$300.00	$ 80.00
1,000– 1,199....	340.00	95.00
1,200– 1,399....	365.00	95.00
1,400– 1,500....	390.00	95.00

22,000–22,999....	2,550.00	1,050.00
23,000–23,999....	2,650.00	1,150.00
24,000–25,000....	2,750.00	1,250.00

* * *

The Siemens Co., of Canada report a further order received by their head office in connection with the Government electrification of the suburban railways of Melbourne, Australia, consisting of 11-2,000 K.W. rotary converter sets complete, with transformers, rheostats, diverters, starting gear, etc., and bringing the total number of rotary converters in connection with this project up to the following:—25 Rotary converters, 2,000 K.W. each; 10 Rotary converters, 1,000 K.W. each; 4 Rotary converters, 500 K.W. each.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Sarnia, Ont.— The Perfection Stove Co. have commenced the erection of their main factory, measuring 300 x 200 feet.

Lethbridge, Alta.— The Richardson Scale Co., Passaic, N.J., will locate a factory here.

Toronto, Ont.—A machine shop to cost $10,000 will be built by the Toronto Railway Co.

The John Deere Plow Co., of Saskatoon, Sask., has been registered in Saskatchewan to do business.

The Canadian Faced Brick Process and Machinery Co., Ltd., has been incorporated at Regina, Sask., with $100,000 capital, and head office at Moose Jaw.

Midland, Ont.—The citizens have voted in favor of bonusing a malleable iron plant to be built by Edward John Vanderboom, of Milwaukee, Wis.

Anyox, B.C. — The 2,000-ton smelter being constructed by The Granby Co. will be ready by Jan. 1. There has been some delay in getting supplies of steel.

Berlin, Ont.—Ground has been broken for the new plant of the Canadian Buffalo Forge Co. The building will be 116x210 ft., with two high bays fitted with electric traveling cranes.

Montreal, Que.—The Montreal Autobus Co., Montreal, Que., will have plans prepared for the construction of a garage. Ross & MacDonald, 1 Belmont St., Montreal, are the architects.

Wallaceburg, Ont.—The Wallaceburg Brass Mfg. Co., Ltd., Wallaceburg, are making an addition to their foundry, costing $5,000, and expect to make a further addition next year. They manufacture valves.

Orillia, Ont.—Following out their policy of concentrating their manufacturing business, the Tudhope-Anderson Co. have decided to move their stove manufacturing plant from Smith's Falls to Orillia during the next two weeks.

Port Arthur, Ont.—The C.N.R. will build a modern car repairing plant in connection with local terminals next summer, at a cost of $30,000. The company has ordered three snow plows from the Canadian Car and Foundry Co. and two locomotives.

Port Arthur, Ont.—The Port Arthur Wagon Works will erect an addition to their plant, for which plans have been prepared. It will consist of a foundry and machine shop for making certain hardware used on the "New Deal" wagon. About $5,000 will be spent.

Chatham, Ont.—The National Forging Co. have taken over the plant known as the Defiance Iron Works and latterly as the Swift Motor Car Co. The new company is capitalized at $100,000, and will make auto and carriage forgings, and sockets.

Edmonton, Alta.—It is announced that J. D. McArthur will move his shops from Transcona to Edmonton immediately, together with all machinery and equipment, it being his intention to do all work in connection with the Edmonton, Dunvegan and British Columbia Railway in this city.

Toronto, Ont.—Fire which broke out last Thursday afternoon in the one-storey frame dwelling at 209 First Ave., owned and used by J. J. Heffron as a machine shop, caused damage to the extent of nearly $800, half of which was done to the machinery in the building.

Toronto, Ont.—The Canada Wire & Cable Co., Toronto, are building a factory 3 storeys, 100x200, at Leaside, Ont.

Hamilton, Ont.—The Canadian Westinghouse Co., Ltd., are building a foundry costing $125,000. Architects, Prack & Perrine, Hamilton.

Regina, Sask.— T. Alfred McAuley, president and general manager of the Canadian Equipment and Supply Co., Ltd., Calgary and Edmonton, will build a warehouse in Regina next spring. The firm handles municipal supplies, steel pipes, hoisting and carrying machinery, cables and heavy hardware.

Medicine Hat, Alta.—The Saskatchewan Bridge & Iron Co., capitalized at $500,000, has started work on the foundation of a new factory here, costing about $150,000. The company will make structural steel for general bridge and construction work. George Harrison, manager.

St. Catharines.—The Lord & Burnham Co., with factories in Irvington on the Hudson, and Desplaines, Ill., will establish a Canadian branch in this city for the manufacture of steel green houses, including frames and boilers, according to a bylaw which went before the city council on Oct. 6, and which will be voted upon by the ratepayers on Oct. 30. The company will pay $10,000 for a site of 16 acres, establish a plant to cost $75,000, and employ at least 100 hands. A fixed assessment of $10,000 for ten years will be granted.

Electrical

Fergus, Ont.—The village will spend $16,000 on an electric lighting plant, if the Hydro-Electric by-law passes. James Beattie, clerk.

St. Catharines, Ont.—The council has decided to submit a hydro by-law to the people on Oct. 30. The sum of $116,000 as an expenditure for plant and distributing is mentioned in the by-law.

Windsor Mills, Que.—The town is considering the development of three or four hundred horse power in this district.

Smithers, B.C.—J. L. Hamilton and J. Fraser are building an electric lighting and water works plant.

Toronto, Ont.—Experts engaged to value the Toronto Street Railway and the Toronto Electric Light systems report the former worth $20,608,035 and the latter $6,132,754. The owners ask the city to pay $22,000,000 and $8,000,000 for them respectively.

Regina, Sask.—A. S. Porter, who is interested in a scheme to supply Regina with power, recently offered it to the city council at 7-10 per cent. per k.w.h., provided they took a certain amount for ten years. The plant will be erected near Estevan, with a capacity of 10,000 h.p.

General Industrial

Montreal, Que.—The Renchard-Elms Shirt & Tie Co., will erect a factory, and are preparing plans.

Windsor Mills, Que.—Plans have been completed for the construction of a bag factory here.

Toronto, Ont.—R. Crean & Co. are building a hat factory to cost $40,000, four storeys, 50x132 ft.

Hamilton, Ont.—The Board of Works has passed plans for a system of overflow sewers costing $650,000.

St. Catharines, Ont.—The Rice Hubert Shoe Co., Courtland, N.Y., are building a factory costing $10,000. Architect, Jos. Daw, 165 St. Paul St.

Victoria, B.C.—The British Columbia Pottery Co. are building a plant to cost $100,000. General Manager, A. T. Monteith.

Stratford, Ont. — The Avon Hoisery Co.'s plant will be trebled in size, and a new factory building 95 x 60 feet, four storeys high will be erected.

Chamcook, N.B.—The Canadian Sardine Co. have re-opened their plant, and will engage 100 hands.

Saskatoon, Sask.—Stewart Tilton and Charles F. Tease have begun a soap factory at No. 112 Avenue South, for which machinery has been purchased from Kansas City.

Port Hawkesbury, N.S.—Good progress is being made on the new cold storage buildings for the Atlantic Fisheries, Ltd., to replace those destroyed by fire some months ago.

Montreal, Que. — The United States Shoe Machinery Co. have taken out a building permit to erect a $300,000 building adjoining their present factory in Maisonneuve.

Sarnia, Ont.—The Canadian branch of Larned Carter & Co., Detroit, overall makers, have ordered 24 new machines, and a new factory will be built at an early date.

Saskatoon, Sask.—From Bavaria an inquiry has been sent to the board of trade for information regarding prospects of establishing a flax industry in Saskatoon. Twenty bales of flax straw are being sent for sample purposes.

Maisonneuve, Que.—The council are undecided regarding the application from the Boston Mechanical Co., who wish to manufacture a special chemical product used in the making of shoes; this on the ground that the process is alleged to be dangerous.

Winnipeg, Man.—An entirely new industry, supplied from the only deposit of its kind in the Western Provinces between Gypsumville, Man., and the coast, north of the Athabasca River, Alberta, is being promoted, and it is intended to capitalize the new company, in which A. J. Norquay and R. McLennan are the Winnipeg representatives at $500,000.

Sarnia, Ont.—The new oil pipe line between the Imperial Oil Works in this city and the Lima oil fields in Ohio has been completed. The line is 154 miles long, and constructed of six-inch pipe. The pumps have been started at the oil fields, but it is estimated it will require five days for the first oil to fill the pipes and reach Sarnia.

Winnipeg, Man.—The Board of Control is in the market for gas testing equipment. M. Peterson, secretary.

Winnipeg, Man.—Tenders will be invited early in the year 1914 for the construction of works necessary for the delivery of water from Shoal Lake to the Greater Winnipeg Water District. The following is a brief description of the proposed works:

1. A dyke and channel for the diversion of the Falcon river into Snowshoe Bay. 2. 85 miles concrete aqueduct. 3. 10 miles pipe line (probably 1916 work). 4. 900 lin. ft. tunnel under Red river. 5. 85 miles of construction railway. 6. Telephone line. 7. Clearing and ditching. Contractors having a view to tendering on the work should send their inspectors over the line at as early a date as possible. M. Peterson, Acting Secretary of the Administration Board, Greater Winnipeg Water District.

Halifax, N.S.—The tin press which is to be placed and worked on the incinerator plant arrived a fortnight ago, from Germany, and John Simon who imported it, is now awaiting the building of a shed by the City, to place the machinery on the plant. Some time ago, the city entered into an agreement with Mr. Simon to permit him to instal the press on the incinerator site and promised that he could use the tins, etc., culled from the city garbage.

Wood-Working

Robertson, Que.—Geo. Rousseau intends rebuilding his saw mill immediately.

Wyoming, Ont.—A by-law to grant a bonus to D. Senecal to assist him in erecting and operating a box and basket factory in this village was carried last week.

Port Hammond, B.C.—The Port Hammond Mill Co. [illegible] resume the operation of their timber mill on a larger scale in a few months. It is believed to have been sold.

Marine

Charlottetown, P.E.I.—The Maritime Telegraph & Telephone Co., Ltd., will build a street railway here.

Vancouver, B.C.—The Burrard Inlet Tunnel and Bridge Co. have decided at once to construct the bridge over Second Narrows if the Provincial Government will not take over the scheme.

Collingwood, Ont.—The second of the two dredges now under construction in the yards of the Collingwood Ship Building Co. for the Dominion Government was launched Oct. 6.

Collingwood, Ont.—It is understood that the Collingwood Shipbuilding Co. will in the near future secure a contract to build a steamer as large as the James Carruthers recently completed.

Port Arthur, Ont. — The Northern Navigation Co. will shortly call tenders for the lengthening of the steamer Huronic during the winter. It is proposed to put on a 60 ft. addition, making her 385 feet long.

St. Catharines, Ont.—Dredging on No. 1 section of the Welland ship canal by the Dominion Dredging Co., began Oct. 9, one dredge and two tugs being at work two thousand feet out from shore at Port Weller excavating for the new harbor. Quinlan & Robertson, sub-contractors for O'Brien & Doughney on section 3, Thorold, have one steam shovel in action and another is being fitted up. The Niagara, St. Catharines & Toronto Railway is rushing work on the track lying along that portion of the work on No. 1 section. Another and larger dredge is expected at Port Weller from Belgium within a few days.

New Incorporations

The Prest-O-Lite Co., Inc., incorporated at Toronto, to manufacture and sell acetylene, and to manufacture and sell other automobile accessories.

Berkel-Freeman Slicing Machine Co., Ltd., incorporated at Toronto, capital $40,000, to manufacture and otherwise deal in slicing and cutting machines, at Hamilton.

Kir-Benn, Ltd., incorporated at Toronto, capital $200,000, to buy, sell, manufacture and deal in wood, iron, steel and other metals, at Almonte, Ont. Incorporators: Alfred M. Greig, William H. Stafford, etc., Almonte, Ont.

Wallaceburg Oil Refining Co., Ltd., incorporated at Toronto, capital $200,000, to manufacture and deal in petroleum and all products thereof, at Chatham, Ont. Incorporators: David A. Gordon, Hugh A. Stonehouse, etc., Wallaceburg.

The North American Development & Construction Co., Ltd., Winnipeg, Man., has been incorporated with a capital stock of $100,000 by Standish R. G. P. Vereker, of Hamsterley, England, W. J. W. Bullock and others to construct and equip hydraulic and hydro-electric plants.

The Westbury Electric Light & Power Co. has been incorporated at Quebec, Que., as an electric light, heat and power company in the towns of Cookshire and East Angus, Que., with $75,000 capital. Incorporators—H. A. Worby, Cookshire; G. W. Allard, Coaticook, etc.

Contracts Awarded

New Denver, B.C.—A Doucette has been awarded the contract for the construction of a powder factory here for the Steelite Explosives Co., of Nelson, B.C.

Montreal, Que.—John Watson & Son, of Montreal, Ltd., have been awarded the contract for the ornamental iron work for the new building being erected for the Imperial Wire & Cable Co. at the corner of Shearer and St. Patrick Sts. W. J. Carmichael, architect.

Sault Ste. Marie, Ont.— In its agreement with this city, the Dry Dock and Shipbuilding Co. guarantees to deposit $25,000 as an evidence of good faith that construction of the plant will commence not later than April 1st next, and will be completed and ready for operation in two years from that date. Ined assessment of $500,000 for the last ten years of the agreement the company now consents to pay the full taxes of $500,000 for fifteen years. The contractors will be Sir Douglas Fox and Co., a well-known British firm.

Building Notes

Assiniboia, Sask.—The Massey-Harris Co., it is reported, will erect a large warehouse here.

Fernie, B.C.—Joseph H. Frankel will erect an abattoir and cold storage plant on Government Block N. 44 adjoining the G.N. track.

Tenders

Victoria, B.C.—Tenders for the construction of two launches equipped with 25 h.p., 3-cylinder, 4-cycle Samson heavy duty engine will be received by W. E. Titchburn, inspector of Indian Agencies, Box 775, Victoria, B.C., up to November 1

Toronto, Ont.—Four new steam pumps are required for the station on Poplar Plains Road, two of 20,000,000 gallon capacity, and two of 7,500,000 gallons capacity. Boilers will also be required. The Board of Control has authorized R. C. Harris, works commissioner, to call for tenders.

Municipal

Hamilton, Ont.—The ratepayers have granted a franchise to the National Natural Gas. Co.

New Westminster, B.C.—On October 18 the ratepayers will vote on a by-law to authorize the purchase of the Westminster Gas Co.

Regina, Sask.—The installation of an artificial gas plant is being agitated at Regina. It is believed that a plant will be installed at the commencement of the coming year.

Goderich, Ont.—A by-law granting a fixed assessment of $20,000 to the Goderich Organ Co., for ten years was carried Oct. 4, by the ratepayers. The Company has some important extensions to its plant in contemplation.

Water-Works

Sarnia, Ont.—A by-law to raise $12,000 to lay waterworks mains will come before the people on October 26.

Peterborough, Ont. — The city engineer will prepare new plans for the sewage disposal plant. A larger pumping station is necessary.

Ottawa, Ont.—Sir Alexander Binnie's recommendation regarding the water supply from the Gatineau Lakes is announced. The total cost will be $8,000,000. Provision is made for 25,000,000 gallons a day, or for 250,000 people. The Gatineau and Ottawa Rivers are to be crossed by bridges.

Trade Gossip

The Dominion Machine & Tool Co., 52 Spadina Avenue, Toronto, are removing to 386 Wellington Street West.

N. S. Steel Co. Output.—Nova Scotia Steel & Coal Co.'s output for September was: Coal mined, 68,800 tons; ore mined, 60,205 tons; pig iron made, 7,225 tons; steel ingots made, 8,800 tons.

The B. F. Goodrich Co. Akron, O., makers of automobile tires, who have been reported several times to be contemplating the establishment of a branch plant in Canada, have abandoned the project.

Dr. Rudolf Diesel, inventor of the Diesel oil engine, mysteriously disappeared from a boat on which he was crossing from Germany to England recently. His body has since been found by a boatman.

The Ottawa & Hull Power Co. have decided to increase their power plant by the addition of two water wheel type alternators, each of 6,750 k.v.a., 120 r. p.m., 2,300 volts, and also two transformers, each 6,750 k.v.a. 2,300-12,000 volts. The contract for this addition has been awarded to the Canadian General Electric Co., Ltd.

Power Company Barred.— "No injunction has been granted against the Edison Electric Co. of Detroit, to restrain them from coming over into Ontario," said Hon. J. J. Foy, Ontario Attorney-General, last week. "If any effort is made to cross the Detroit River at the point where it is anticipated the company wish to cross over into Essex, steps will be taken to stop them, and to conserve the rights of Ontario."

The Heaps Engineering Co., Ltd., who own the Schaake Machine Works at New Westminster, B.C., had a first-class display of machinery at the New Westminster Fair held recently. This included the Schaake shingle machine, two lath machines, two sizes of the Yale gasoline-distillate marine engine, and spare parts. The Schaake Machine Works were established in New Westminster fourteen years ago, and two years ago were taken over by the Heaps Engineering Co., Mr. Henry Schaake remaining as manager.

Personal

Dr. J. S. Unger and Chas. E. Dinky of the United States Steel Corporation, who were cariboo shooting in Nova Scotia recently, returned by S.S. Prospero from Sydney, last week.

Guy H. Morton, B.A.Sc., manager of the Calgary office of the Canadian Westinghouse Co., has been appointed lecturer in electrotechnics by the technical education committee of the Calgary Board of Education.

A. Junkens, vice-president of the Westinghouse, Church, Kerr Co., who were awarded the contract for erecting the C.P.R. depot and docks at Vancouver, recently inspected the work being done.

Collingwood Smith, the young son of the general manager of the Collingwood Shipbuilding Co., performed the christening ceremony of a Government dredge launched last week at Collingwood.

Stanley N. Graham, an Ontario man, has been appointed to the Chair of Mining, Engineering at the Nova Scotia Technical College, recently vacated by Prof. E. A. Holbrook. Mr. Graham was at one time on the staff of the Dominion Coal Co. Later he acted as instructor in mineralogy in the Kingston School of Mines, of which school he is a graduate.

WELSH TINPLATE WORKS IN CANADA.

THE American Consulate at Cardiff, England, forwards an abstract from the South Wales Daily News, which discusses "How to meet American competition" in the tinplate trade of Canada. It says in part:

A movement is on foot among the Welsh tinplate manufacturers to form a Company for the erection of works in Canada. This would give them the advantage of the Canadian anti-dumping law, and so enable them to compete on equal terms with the United States. "Generally speaking," said a man associated with the South Wales tinplate industry, "many of the big firms in South Wales are interested, and though so far the matter is still the subject of discussion, and no definite steps have been taken, it is being very seriously considered, and unless something unforeseen happens by which South Wales may be placed on an equal footing with the United States in regard to the Canadian trade in tin plates, there is every likelihood that the proposal will be carried through."

Canadian Tinplate Import Statistics.

Import statistics of tin plates into Canada show the declining sales of British plates (hundredweight = 112 pounds):

	From England Cwt.	From United States Cwt.	Total Imports. Cwt.
1899	325,531	5,976	331,507
1900	480.794	21,374	543,290
1905	406,455	193.550	600.005
1911	269.907	670,086	939,993
1912	180.797	1,029,081	1,209,878

When the Canadian works stopped making tin plates the anti-dumping law ceased to operate, and this let the Americans in, with the result shown in the table. Furthermore, freights from Wales have increased enormously. Formerly they were $1.81, now they are $3.87, and the Steamship Companies now insist on boxes being hooped.

◆

INFORMATION FOR INVENTORS.

PIGEON, PIGEON & DAVIS, patent solicitors, 71a St. James Street, Montreal, report that 137 Canadian patents were issued for the week ending September 23, 1913, 86 of which were granted to Americans, 21 to Canadians, 20 to residents of Great Britain and colonies, and 10 to residents of foreign countries. Of Canadians who received patents, 9 were residents of Ontario, 8 of Qeuebc, 1 of Prince Edward Island, 1 of Alberta, 1 of Saskatchewan, and 1 of British Columbia. In the United States, for the same week, 514 patents were issued, 8 of which were granted to Canadian inventors.

Catalogues

The Vulcan Engineering Sales Company, Chicago, Ill., have sent us a copy of their new catalogue No. 51, dealing principally with the "Mumford" moulding machines. Each type is clearly illustrated and the principal features described fully. Descriptions and illustrations are given of the "Hanna" shakers, riddles, etc., and the Q.M.S. jib cranes, trolleys, hoists, etc. The catalogue also contains a list of users. Copies may be had by writing.

The Canton Foundry & Machine Co., Canton, Ohio, have sent us a catalogue describing the Canton alligator shears which they manufacture. Each type is illustrated, together with a brief specification and a description of the principal features. The catalogue is well got up, the reading matter and illustrations being very clear.

The L. S. Starrett Company, Athol, Mass., have sent us a copy of their catalogue describing their hack saws and frames, and a pamphlet dealing with the Starrett vernier calipers. The former contains illustrations and particulars of each size of hack saw and frame which

GARVIN CIRCULARS

Frequent changes necessitate issuing circulars from time to time to keep our printed matter up to date. The following is a list of circulars, profusely illustrated, describing our latest improvements on the various machines mentioned. If any of these circulars may interest you, we shall be pleased to send you same on request.

We have in preparation a new catalogue, which will include our complete line, and will be ready for distribution shortly.

they manufacture. Some useful information for users is given, including the kind of work for which each saw is best adapted. In the latter the vernier caliper is fully described and illustrated with a full explanation of how to read the vernier. Copies of the above will be gladly sent to interested readers.

Noiseless Gear Driving is the title of a catalogue which the New Process Gear Corporation, Syracuse, N.Y., have issued. The catalogue contains a description of the gear and several illustrations of various installations; also some useful calculations on power transmission and suggestions for ordering these gears. The method of manufacture is described, and includes sectional views of the various types. A complete price list is also given. Copies may be had on request.

The Department of the Interior, Bureau of Mines branch, of the United States Government, Washington, D.C., has issued a bulletin covering coal mine fatalities in the United States for the month of July, 1913. The figures are compiled by Albert H. Fay.

The Cowan Trucking System is the title of a handsome catalogue which we have received from the Toronto Type Foundry Co., Ltd., Toronto. The catalogue contains a number of photographs showing the "Cowan" truck being used in various factories, indicating the many purposes for which this truck can be used. Each type of truck is illustrated and a specification given. The catalogue also contains a complete list of replacement parts with numbers.

The Queen City Machine Tool Co., Cincinnati, O., have sent us a series of bulletins dealing with the Queen City plain cylindrical grinder and shapers which they make. A complete specification is given for each machine, and the illustrations show the general design as well as some of the principal ideas embodied. One interesting feature is the clear manner in which these ideas are shown by means of sectional drawings.

The Can. General Electric Co., Ltd., Toronto, have issued bulletin B-3257,

Why The Advertiser Succeeds.

¶ Why is it that during the last few months, when money was admittedly tight, the manufacturers who advertised the most felt the pinch the least?

¶ And how is it that now, when the circulation of money is less restricted, the manufacturers who felt the pinch the most will be the last to experience relaxation and relief?

¶ The same wisdom and foresight which prompts a manufacturer to advertise will naturally guide him in forming his whole selling and general business policy, and, like a good general, he is prepared for every contingency and emergency.

¶ The fact that the successful business man is an advertiser is usually incidental. He is an advertiser because he is wise and possessed of good sound business sense and an analytical mind. At some time or other he came to the conclusion that advertising could be made one of the mightiest factors of his business organization, and having arrived at this conclusion, he just naturally went to it and advertised.

¶ He had faith in his product, and his own faith manifested in a public way, inspired confidence in the minds of his prospective customers. His name and his manufactured product became synonymous with good service and satisfying quality. The public became acquainted with the merits of his line and familiar with its outstanding features.

¶ Consequently, when conditions were normal, he secured a liberal share of business and received first consideration when purchases were made.

¶ When money tightened and business was curtailed, he continued to get the lion's share of what was going. When purchases were carefully considered the advertised line received first attention and usually secured the order.

¶ And now that the financial tide is coming back, the advertiser is getting the biggest slice of the business melon, simply because during those cloudy days of curtailment, his advertising message had been studied and absorbed at a time when the public mind was most receptive.

¶ It pays to advertise if your line is good, and it pays to buy advertised lines, because they are invariably satisfactory. The general public have long been educated to believe that advertised goods are best. Can't you see that you are laboring, not only under a handicap, but under a cloud, if your product is not advertised? Publicity dispels the cloud of suspicion and removes the handicap.

¶ You'd better hop on to the band wagon right away. Hopping on now, when the prospects for big business are so bright, will be not only timely, but extremely profitable.

Rate Card and full information gladly furnished.

which deals with fractional horse power motors and their applications. These motors are of the drawn shell type, and are made in small sizes up to 1 h.p. A full description is given, together with illustrations showing the various purposes to which these motors can be applied. Copies of this bulletin may be had by writing.

The Progress Reporter contains, in its September issue, descriptions of a number of large modern tools, including a 100 in. gun boring lathe, projectile boring lathe, a large multiple spindle milling machine, Pratt & Whitney surface and disc grinders and vertical shaper, etc. This publication is got up in its usual high class style, the reading matter being descriptive and in clear type, while the illustrations leave nothing to be desired. The Niles-Bement Pond Co., New York, will be glad to send copies to interested readers.

The Pawling & Hornischfeger Co., Milwaukee, Wis., have sent bulletin No. 301 describing the "P & H" type "U" hoist which they manufacture. This hoist, which is electrically driven, is built to operate at normal speeds and for ordinary purposes. A full description is given with the illustrations. The bulletin contains diagrams and tables giving the principal dimensions and clearances for the various types, also a table giving speeds for different movements and weights.

THE MONTH OF SEPTEMBER IS GONE
and the only reason you have not come into possession of a new revenue-producing enterprise is because you have failed to adopt my previous suggestions that you write to me stating your willingness to consider patented improvements which have proven successful on the American side.

DISASTROUS FIRES PREVENTED!

There is one sure way of preventing the destruction of your factory by fire. It is so certain in its action that Insurance Underwriters allow a rate of insurance on a protected building from 40 to 80 per cent. lower than on an ordinary unprotected structure.

Manufacturers' Automatic Sprinklers

afford real protection from fire. They can, and should be installed in either old or new buildings.

They save their cost in from three to five years in the reduction of insurance premium.

Do Your Stools Break ?

Have You Replacing Expenses ?

The trouble with the ordinary stool is the constant expense of replacing because they break so easily.

Our stools are practically indestructible and help to keep expenses down. They are just as neat in appearance as other stools plus the lifetime service and economy.

We make Wire Guards for all purposes. Tool Room Partitions.

Send a post card for full particulars and descriptions.

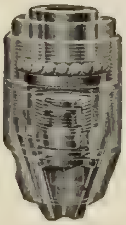
Hamilton, - Ontario

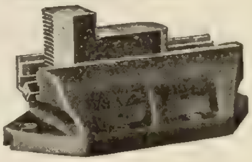
A Chuck For Every Purpose

Look Over This Complete List

Iron Body Indpendent Chucks, Steel Body Independent Chucks, Face Plate Jaws (Iron and Steel), Boring Mill Jaws (Iron and Steel), Geared Screw Chucks (Universal and Combination), Universal and Independent Two-Jaw Chucks, Geared Scroll Chucks, Drill Chucks, Planer Chucks.



Morrow Drill Chuck



New Face Plate Jaws

It pays to send your inquiry to a manufacturer who is familiar with all types. You not only get better advice and explanations as to comparative features but often we can save initial cost by advising a lower priced chuck that will do the work.

Write for our 48-Page Condensed Catalog—full of distinct specifications and details, or ask regarding delivery and special service in the Dominion.

Heavy Duty Dog

Scandinavia Belting

A belt so well made as to stand the constant rubbing when the belt is crossed can be depended upon for long and satisfactory service. Scandinavia is not injured by this rubbing as it is thoroughly anti-frictioned and is woven intensely strong. Write for interesting belting book—"The Main Drive."

The First Law

of nature is self-preservation. To save yourself is natural. But why need you have conditions in your plant to warrant the carrying out of this law. One of the worst danger factors you have to deal with is the projecting set screw. Why not safetify your factory by using

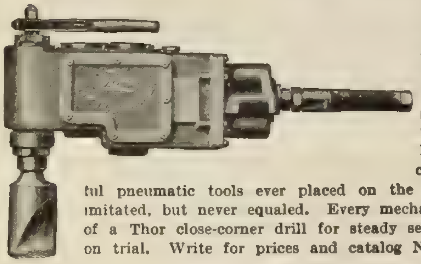
Allen Safety Set Screws

throughout. A small article but a great big trouble saver.

Your dealer carries them, so the next time his salesman calls just say ALLEN to him, and see how he "comes back." Send for circular!

THE ALLEN MFG. CO., Inc., HARTFORD, CONN.
Canadian Factory: St Johns, P. Q. Canada

Thor CLOSE-QUARTER PISTON AIR DRILLS



Are the original Nos. 8 and 9 motors for close-corner work. The neat and compact construction of these drills, together with the design of the mechanical parts, have resulted in their becoming the most successful pneumatic tools ever placed on the market. They are often imitated, but never equaled. Every mechanic appreciates the value of a Thor close-corner drill for steady service and economy. Sent on trial. Write for prices and catalog No. 9.

A Valuable New Book on an Important Trade

PATTERN-MAKING

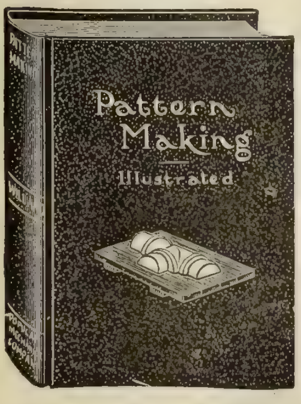
By G. H. WILLARD

Two Significant Opinions:

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

224 Pages. 312 Illustrations. Cloth Cover.



With Additional Chapters on Core-Making and Molding

"WRITTEN SO YOU CAN UNDERSTAND IT."

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

Chapter Headings

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding Pattern Work.

Part II.—Core-Making and Molding.

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

Price $1.10 Postpaid

Buy Where Buying's Good

¶ When you open "CANADIAN MACHINERY" you have come upon a most remarkable community of machinery manufacturers.

¶ You have entered a great Machinery Market Place where admission is by quality. A Market Place where those who sell are essentially progressive and those who buy invariably well pleased.

¶ It will pay you to do your buying here, where buying's good.

Use Canadian Machinery's Directory in doing your buying

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.
TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.
TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

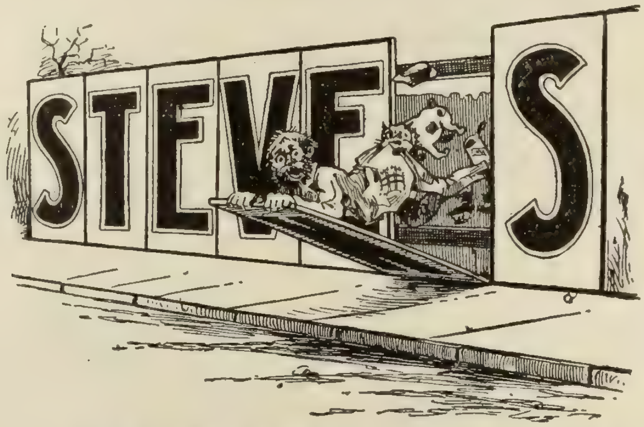
CASTINGS

ALUMINUM CASTINGS

Alloy No. 12, No. 24 and No. 25 are used for specific purposes, about which we can tell you if you will ask us.

LUMEN BEARING COMPANY
Brass Founders
WEST TORONTO



THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

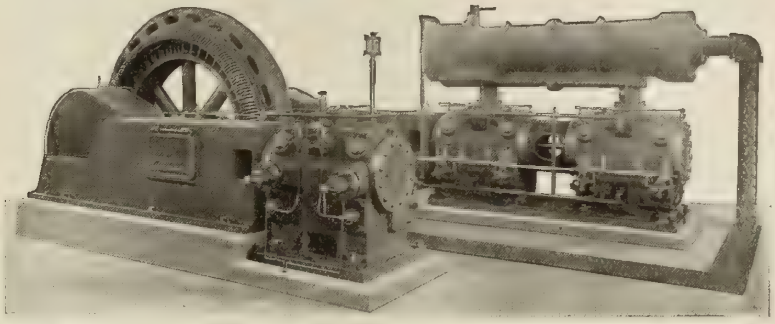
Automatically Prevents Waste Compression



The Bury 3-Cylinder Variable Volume Air Compressor

PATENTED

Represents a very decided departure from the usual compressor design — particularly so as regards the old style compressor with choking intake control, a type which has *always* been wasteful.

Waste compression—waste energy—are both eliminated in this Bury 3-cylinder machine, through the automatic variable volume unloading system.

The operation is entirely automatic. The air supply is controlled through separate and independent variable volume unloading valves attached to each end of two low-pressure cylinders—shown on the side of the cylinders—and two similar valves on each end of one high-pressure cylinder.

These unloading valves are regulated for close variation of 1 lb. drop in pressure to control the intake supply of air for full load, or ¾ load, ½ load, ¼ load, or no load, to meet requirements for air for any period of time, for fraction of day, or whole day, or as desired, automatically.

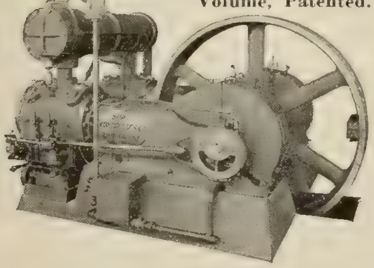
This regulation stops compression in either one, two, three or four ends of two low-pressure cylinders, automatically, and in unison with high-pressure cylinder, automatically, as adjusted to meet such requirements.

In this manner, it is possible to regulate the peak load of compressor for any period of time, thus saving proportionately by lowering power cost, based on daily peak load.

Other Advantages Are:

Low power cost per cubic foot compressed air delivered. High air delivery output. The volumetric efficiency remains constant through the entire range of loads. No overheating of compressed air delivered. No wire drawing or choking of air at any part of load. Unloads at the close variation of 1 lb. by the quarter. Avoids undue heating of discharge air at any load. Prevents any vacuum in air cylinder or intercooler at any period of operation.

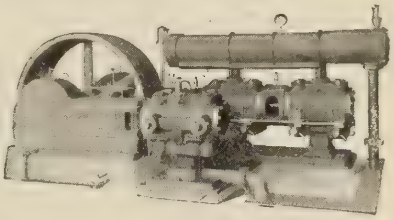
All sizes, all types for all pressures, for mining, general manufacturing, foundries, glass factories, and meeting all engineering requirements.



Duplex Type—Variable Volume, Patented.

We can save you many $100.

Write us for our Proposition with our Guarantee.



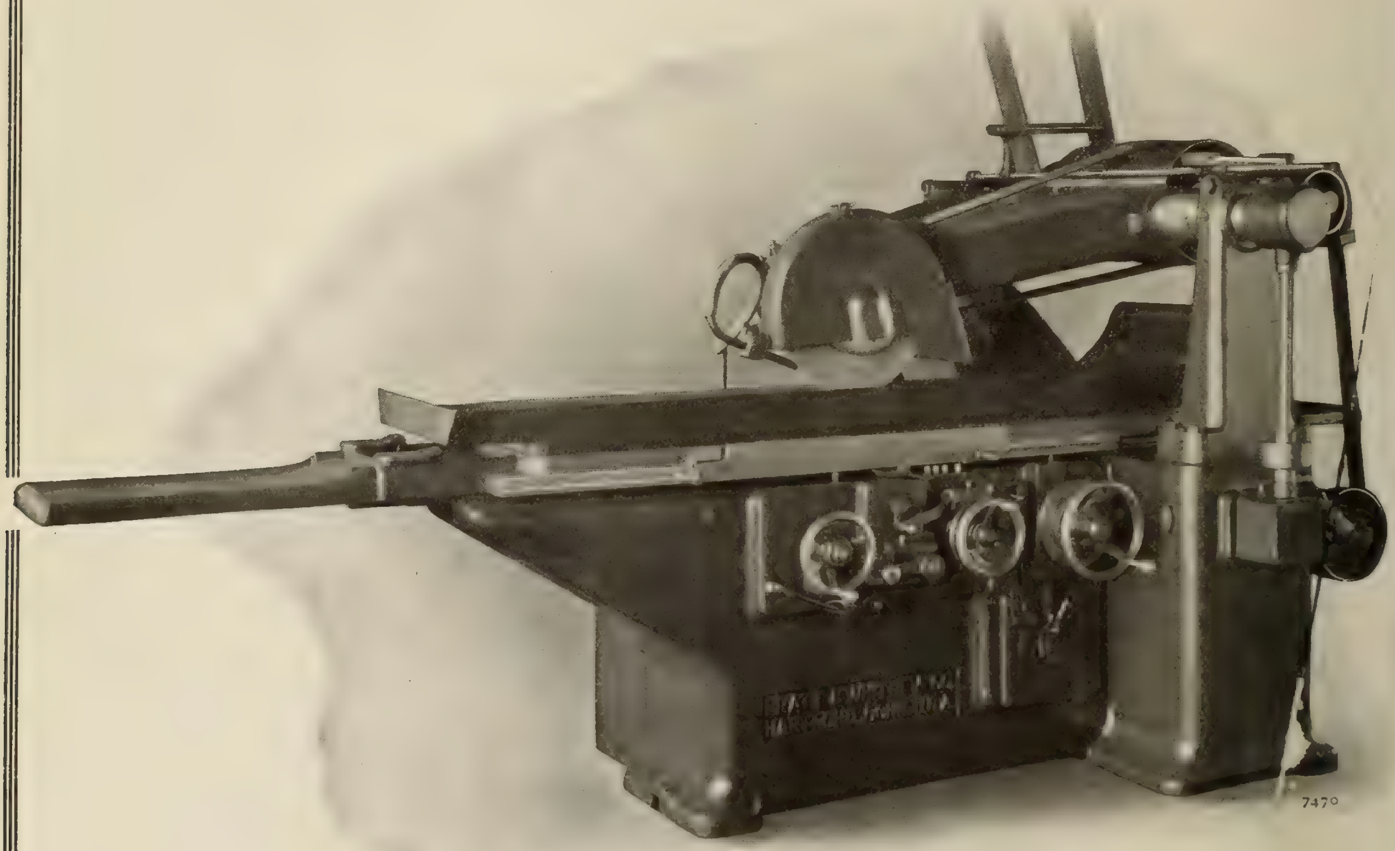
Bury 3-Cylinder Variable Volume Type, with band wheel; belt driven from Motor. Patented.

BURY COMPRESSOR COMPANY, ERIE, PA., U.S.A.

Canadian Representative: A. R. Williams Machinery Company, Toronto, Ontario.

Another New P. & W. Grinder

Especially adapted for work with surfaces at different heights and angles. Of extreme stability throughout and provided with large, properly supported and powerfully driven wheel



P. & W. 4-Foot Horizontal Surface Grinder

Far Superior to Machines Previously Used.

The large variety of work that cannot be handled with a cup wheel due to surfaces at different heights, has heretofore been handled by a slow and expensive process on either a planer type or tool room grinder. This new P. & W. Grinder has proved, under severe tests, to be superior to either of above mentioned types of machines. It not only produces very accurate work, but is also very rapid, consuming only a fraction of the time required by the old method.

Automatic Table and Wheel Feeds.

Table has automatic reciprocating motion. Wheel has both automatic and hand horizontal feeds. Wheel also has vertical feed controlled by handwheel on front of machine.

Efficient Method of Mounting Wheel.

A very important and original feature is the method of mounting the wheel in an arm, thus eliminating the objectionable slide-construction. Arm has perfect fit on an arbor which is substantially supported upon two uprights. This forms a very rigid construction, the wheel being supported without overhang.

Liberal Supply of Water.

As an ample supply of water is absolutely necessary to keep wheel free and prevent heating of work, this machine is provided with a new type of pump capable of supplying an abundance of water. Both table and wheel are provided with guards to prevent escape of water.

Write us about your work. This
may be just the machine for it.

One Man Sold 19

"Clipper" Belt Lacers

TRADE MARK LACES IN THREE MINUTES

In 21 Calls In Montreal

Canadian Manufacturers are wide awake. They see quickly how time-saving is money-saving. The

"Clipper"

laces a belt in 3 minutes or less, as against 10 to 20 minutes the old way with rawhide. This saving in machine-time and labor-time, and the consequent increase of output will pay for the Clipper in a week, in some plants; in a month in many plants.

How It Works

Any strong boy can do it—simply insert a card of hooks into the machine and by pressing the handles, sink this whole row of steel hooks into the belt-end. Do the same with the other end, then join the two over the pulley by inserting our "Fibro" pin.

You don't have to remove belt from shaft, as the machine weighs only 19 lbs., and can be carried to the broken belt.

We are establishing Jobbing Connections all over Canada, and

can supply a machine duty-paid for $20.00 through any of these dealers.

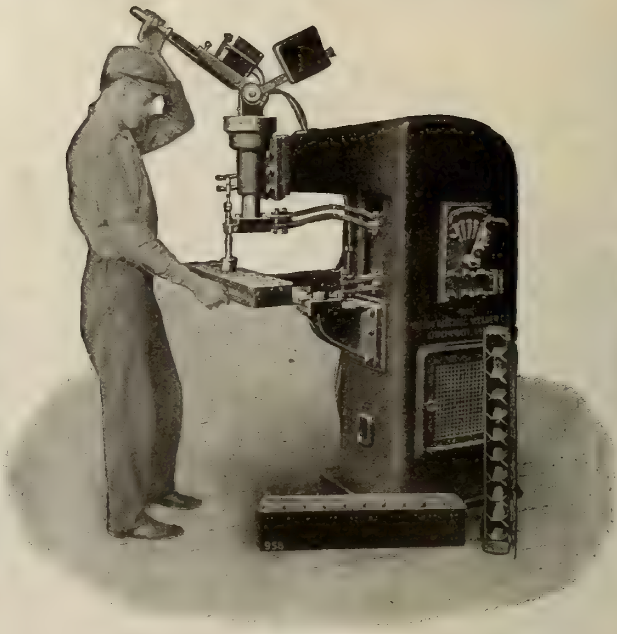
Free Trial Offer

To demonstrate the value of this machine at our risk and expense, we have authorized our Canadian Dealers to supply any manufacturer who requests it, a Clipper Belt Lacer and a quantity of lacing hooks on a 30 days' free trial basis.

Give us name and address of jobbers or mill supply house from whom you buy belting and we will arrange to have him supply you a machine on this basis.

CLIPPER BELT LACER CO.
998 Front Ave., Grand Rapids, Mich., U.S.A.

Riveting Costs Reduced



Over $140.00 per month saved on this job. One boy and a

"TOLEDO"

Spot Welder replaced 8 riveters and does a neater and better job. Had hard work to convince the manufacturer he could save anything over the old way—but our *30 days free trial* was sufficient proof. The same offer is open to you; do you want to try one?

THE TOLEDO ELECTRIC WELDER COMPANY

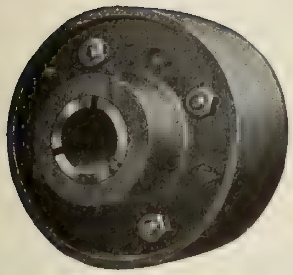
CUMMINSVILLE, CINCINNATI, OHIO

SHAFTING COUPLINGS

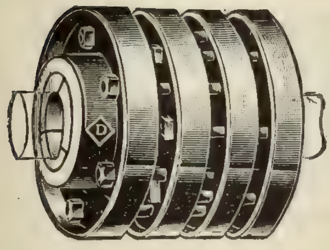
Solid Sleeve

DODGE SOLID SLEEVE

A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.



Single Compression



Double Compression

DODGE KEYLESS COMPRESSION

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.

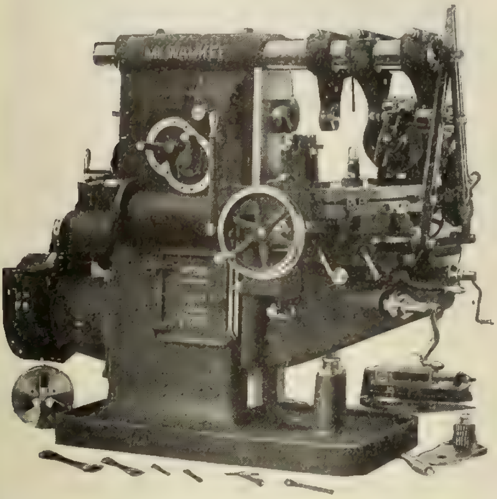
WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 11
Feeds

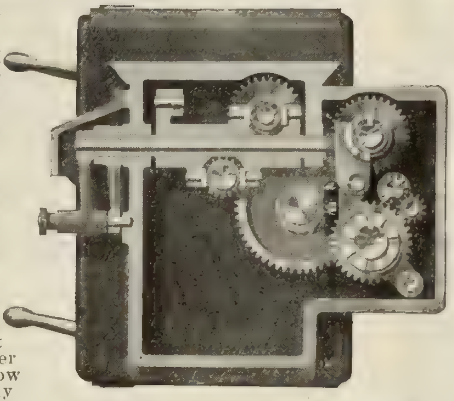
You have been shown how Milwaukee Millers are made extremely rigid, and have been told of the strength of their constant speed drive. Now we come to the third chief consideration in a milling machine—the feed.



Feed in Milwaukee Millers is driven from the constant speed gear on the feed box and the amount of power going into it automatically depends on the conditions and requirements of the cut. No two feeds can be accidentally placed in operation at once.

Twelve changes in geometrical progression are provided in the feed box, ranging from ½-inch to 16 inches per minute without reference to speed of the spindle, the ratio being about 1.35.

Fewer changes of speed are required where this system of feed drive is used as it provides finer feeds for small cutters at high rotative speeds and coarser feeds for large cutters at low rotative speeds than can possibly be obtained by any system of feed driven from the spindle, regardless of how many changes are used.



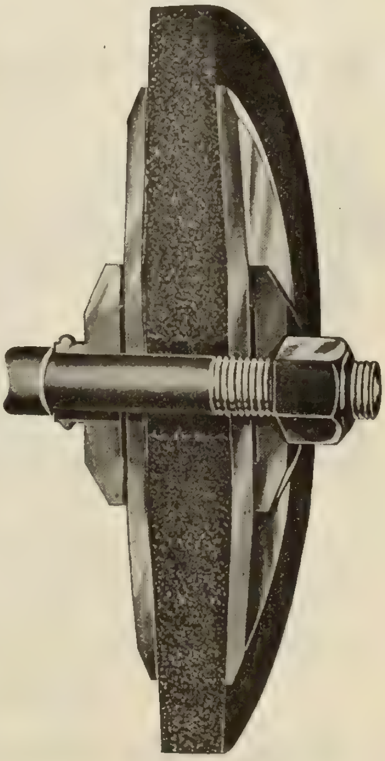
This power is carried from the feed box forward by a universal joint shaft with all its parts made of steel. The centre block is square and forms an oil reservoir to keep the parts thorough lubricated.

The seeker after the best in milling machines should have our Bulletins. They give all the "WHYS" in favor of Milwaukee Millers.

KEARNEY & TRECKER CO.,
MILWAUKEE WISCONSIN

Canadian Agents— A. R. Williams Machinery Co., Toronto, St. John, Winnipeg, Vancouver: Williams and Wilson, Ltd, Montreal.

"SAFETY FIRST."



Despite the fact that Abrasive Wheel Manufacturers are continually improving their product, accidents from Emery Wheels breaking with serious and often fatal results continue to occur in large numbers, where precautions are not in use. Steel Taper Safety Flanges and Taper Wheels made to the approved Standard, are the solution. It will pay you to investigate Safety Flanges, both from your own, and the operators standpoint. Our Standard Line is that approved by the Factory Inspectors, and the Emery Wheel Manufacturers, and the Taper Wheels cost no more than regular wheels.

Write us to-day and get the price list.

Man's Ideal City

The healthy mind divides life into two distinct conceptions: one is the world of our everyday affairs, the world of actual contact with things; and the other is the world of fancy, the kingdom of our mind or the ideal city of our better self.

In our ideal city live our ideal men and women, and it is here that we do things the ideal way. These two conceptions, though entirely distinct, reflect on each other to such an extent that **a man who may be classified as an idealist or a mystic is oftentimes strictly and severely practical.**

To be practical means to co-operate with the laws of nature, and this means to travel toward the ideal city, the ideal business, toward that degree of perfection where we do things the ideal way. This applies not only in business affairs, but in our relation with other men—in our mental and physical conduct; so there is a practical idealism and every man who has accomplished things worth while is first and foremost an idealist.

Every healthy, normal man can build a world in which he may live independently; a kingdom of his own of which he is the ruler; a world in which he may enjoy the finest companionship, the companionship of his own beautiful aspirations; the companionship of the people he has created for his ideal city.

History has supplied us many examples of idealists who were practical men. Such an example we find in Pericles, the man who made Athens the most beautiful city of all time. Athens, the ideal city, existed first in the mind of Pericles; and we are still learning from the Athens that existed two thousand and three hundred years ago; we are still studying her architecture; still finding inspirations in her sculpture, literature and government.

The city of our mind is the city we build for ourselves, and this city is merely a beautiful conception we evolve to represent the finest, cleanest and most natural moments of our lives.

Every man should have an ideal and should live as nearly as possible an all-round, beautiful life—at least, he should have a clear understanding of what a life of this kind really is. Our ideal represents the best we know and understand, as this creation of mind is the result of crystallized experience, plus our poetic vision. Every man should have a high conception of conduct, a clean conception of business, of relation between himself and his fellows.

Most men who have accomplished things have come through a crucible of experience, which has in most cases evolved an idealistic conception of life at a very early period. This is a condition of mind which takes hold of us at an early age—that stands first and foremost in all the things we do and say.

We often say, 'this man is **great**, a man of **genius**, a man of **size**'—and we are right; because this man formulated an ideal, away back in the beginning of his life, and has driven straight ahead until that early ideal has been realized. So, happy is the man who builds an ideal city, for **without an ideal, life is vanity, work is drudgery, responsibility** is slavery.

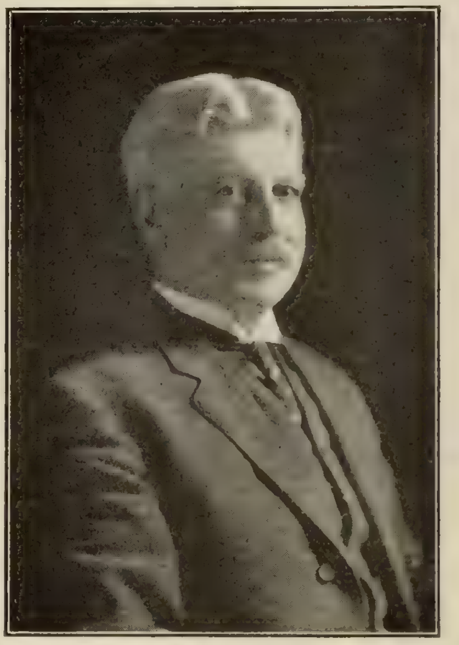
ERNEST G. HENDERSON

IT was noticed at the Annual Meeting of the Canadian Manufacturers' Association held in Halifax recently, that when a certain Toronto gentleman introduced a scheme for the nationalization of the Canadian Northern Railway, one of the delegates took it cum grano salis, and unlike the rest of his fellows, expressed his thoughts on the subject with vehemence. He did it so forcibly, all eyes were focused his way. Later he came into prominence when elected Vice-president of the Association, which means that Ernest G. Henderson, general manager of the Canadian Salt Co., will be the 1914 president of the C. M. A.

Being an Irishman, it was necessary for E. G. to emigrate, but he did this only after a successful career as a railway engineer in Ireland. It was the C. P. R. who found him, and used him until he fell into the salt business. Since then he has never looked back.

It will interest readers of "Canadian Machinery" to know that Mr. Henderson put in four years as a mechanic, so that besides being an expert railway man and a chemist, he knows how to manipulate machine tools as well. For four years he worked in the shops of the Belfast and County Down Railway as an apprentice.

Let us start at the beginning, however. It is strange how so many successful men, and successful engineers particularly, began life as the sons of clergymen. The pulpit seems to be a stepping stone to some of the biggest jobs in the world. Ernest G. Henderson was the fourth son of the Rev. Henry Henderson, and was born at Holywood, County Down, Ireland. He was educated at Hillbrook School, and at a Belfast college, later becoming an articled pupil to the engineer of the Belfast and County Down Railway. Having served his apprenticeship he was given the position of assistant engineer of the above railway, but in 1879 accepted the position of assistant engineer on the Ulster Division of the Great Northern Railway of Ireland.



E. G. HENDERSON,

Vice-President Canadian Manufacturers Association.

In 1883 he came to Canada, and was engaged on surveys and construction of the main line of the Canadian Pacific Railway, and in the remeasurement of certain sections of that railway north of Lake Superior, where disputes had arisen between the C. P. R. and some of the contractors, notably Conmee and MacLennan. In 1888 Mr. Henderson was appointed C. P. R. assistant engineer at Toronto, and afterwards resident engineer in London, Ont., resigning that position to become general manager and vice-president of the Windsor Salt Works, now known as the Canadian Salt Co., Ltd. The salt plant at Windsor was the first modern factory for the manufacture of salt erected in the Dominion, and for years the only salt works in the British Empire which used the vacuum process. In addition to the manufacture of salt, the Canadian Salt Co. have lately erected at Sandwich a large factory for the manufacture of caustic soda and bleaching powder by the electrolytic process. Both the salt plant at Windsor and the chemical plant at Sandwich, were erected under Mr. Henderson's direction.

Windsor has known E. G. Henderson for eighteen years, and known him well, for he is one of the city's public men. He has been president of the Board of Trade, a member of the school board, and was a delegate to the Sixth Congress of the Chambers of Commerce of the Empire.

The new vice-president of the C. M. A. is a bit of a genius. Besides handling the various lines of work enumerated above, he has worked as a hymnologist. He was one of a committee appointed by the Anglican Church in Canada to compile a new hymn book, and has tried his hand at revising the Prayer Book too. So Mr. Henderson is an Anglican, and, it almost follows, a Conservative in politics.

These are his clubs: County Club, Sandwich; Detroit Club, London Club, and the Albany Club, Toronto. He is a member of the Canadian Society of Civil Engineers, and a member of the Institute of Civil Engineers of Ireland.

Some Features of the Intercolonial Railway of Canada

This Government owned utility fills a large place in the development of the Maritime Provinces, and at the present time is attracting considerable attention on account of the proposed increase in freight rates, and the reorganization being effected since the appointment of Mr. F. P. Gutelius to the management.

ON the Intercolonial Railway of Canada, there are now nearly 1,700 miles of road in operation of the standard 4 ft. 8½ inches gauge, with 397 locomotives, 447 passenger cars, 12,025 freight and miscellaneous cars, and 78 snow plows. The road traverses the most varied and inviting scenery.

Starting at Montreal, the Intercolonial crosses the Victoria Jubilee Bridge on the St. Lawrence, and takes the shortest route to Quebec which is full of historic interest. Passing along the southern shore of the St. Lawrence, the road makes its way among picturesque French-Canadian villages, after which the romantic and beautiful scenic wonders of the mountainous districts is passed until Dalhousie on Chaleur Bay is reached. Here the great moose hunting and big game territory begins. A string of thriving towns has recently sprung up all along the road through New Brunswick. At Moncton the strange tidal phenomenon known as the Bore is first seen, and forms a remarkable feature of this interesting country.

Near Moncton is Point du Chene where steamers connect with the Prince Edward Island railway, the main line continuing to the furthest point of Nova Scotia, at Sydney, which together with North Sydney, is rapidly becoming a great commercial centre. A separate branch runs south through the center of Nova Scotia to Halifax. The entire route from Montreal to Halifax or Sydney is of surpassing interest, and the road and equipment are among the best in North America.

The Moncton Shops.

With regard to the principal repair shops which are located at Moncton, it will be recalled that they were completely destroyed by fire in 1906, and plans were immediately made for extensive works which now completed are among the largest and best equipped on the continent. The locomotive erecting shop, 375 feet by 80 feet, is itself more than twice as large as the old shops, and is arranged in departments each caring for certain similar parts of rolling stock. The machines are mostly motor driven. The pits are placed at an angle, or herring bone fashion to economize space. Two 60-ton electric cranes handle locomotives and all material needed in repairing same. The machine shop proper is divided into two bays, each served by a 10-ton traveling electric crane. These serve every machine tool, thereby abolishing hand and air cranes and leaving the shop light and open.

The brass and tool room is situated on the north-west side of the machine shop, and compares favorably with the old shop, having 3,800 sq. ft. more floor. The brass foundry adjoins, and between the two are placed racks for storing the castings on their way to the brass room. In the tool room where small tools are stored is located a grinding department.

Passenger Car Shops.

The passenger car and paint shops comprise two buildings each 361 feet by 100 feet, and are built to handle 34 passenger cars; 22 was the capacity of those shops destroyed by fire. Between the shops is placed a traveling table on which the cars are placed for transfer to or from either shop or to the yard. This out-door table is placed well above the ground, so as to be clear of snow.

Car Repair Shop.

The freight car repair shop is arranged to accommodate 42 cars, and the ad-

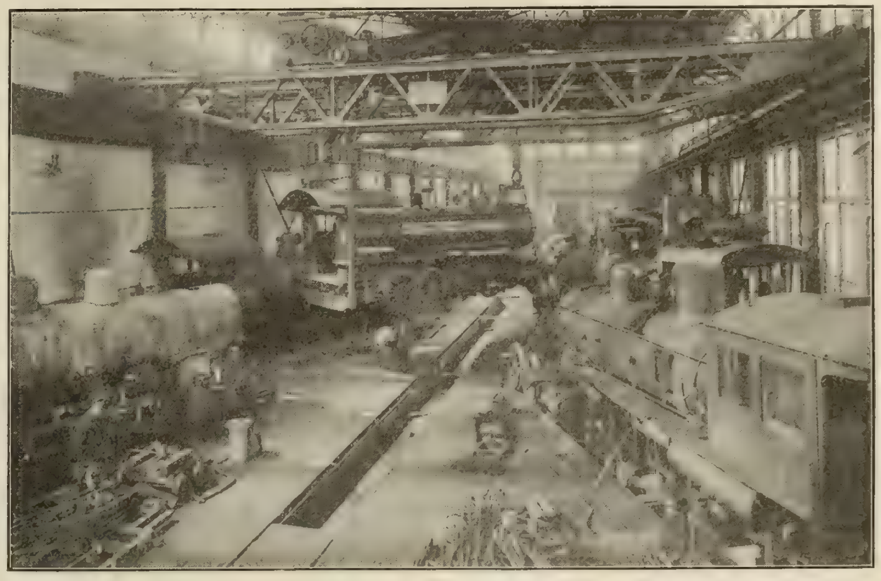
joining planing mill is 203 feet by 82 feet. Only heavy lumber for freight and passenger cars is handled here. All of the new machines and also quite a number of the old machines are driven by separate motors; some of the related machines are grouped.

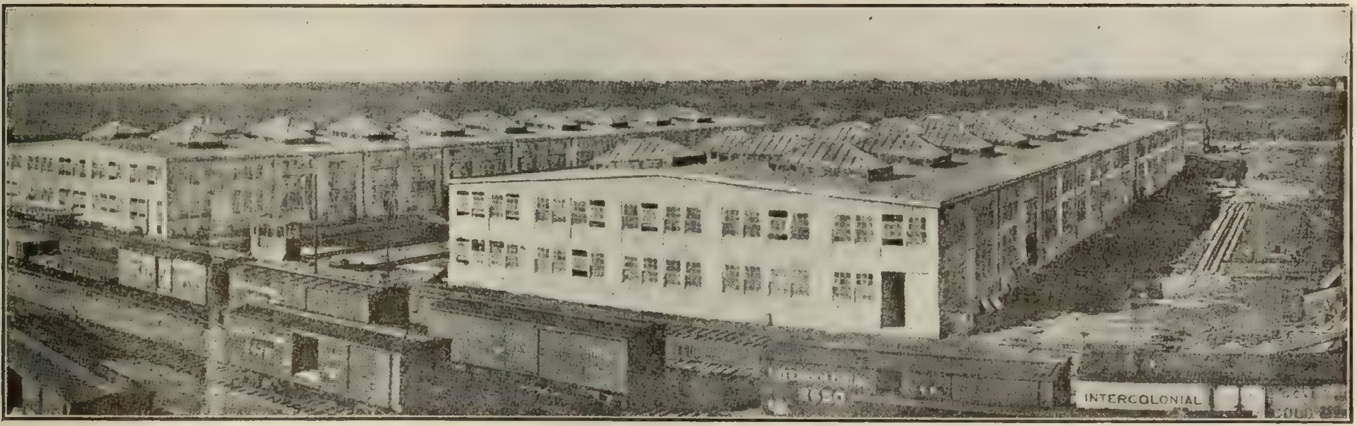
The power-house, 203 feet by 62 feet, is divided into two parts, and in one is placed three boilers of 500 horse power each, and two fans for supplying heated air to the blacksmith and freight car repair shops. In the other part of the power house, two 500 horse power tandem gas engines direct connected with 300 kilowatt generators supply power to the shops. An air compressor of 2,000 cubic feet per minute capacity supplies air for all pneumatic purposes.

The Boiler Shop.

The boiler shop, 225 feet by 100 feet, is equipped with a 35-ton travelling electric crane, and a full complement of the latest machinery. A 10-ton crane is also in operation on one side of the shop. The smith shop, 375 feet by 75 feet, is equipped with furnaces operated by natural gas and arranged in pairs, and 5 large single forges. A number of steam hammers are in operation. The smoke is carried out beneath the floor by the down draft system, leaving the shop entirely clear.



TWO 60-TON OVERHEAD ELECTRIC TRAVELLERS LIFTING A 120-TON LOCOMOTIVE, I.C.R. SHOPS, MONCTON, N.B.

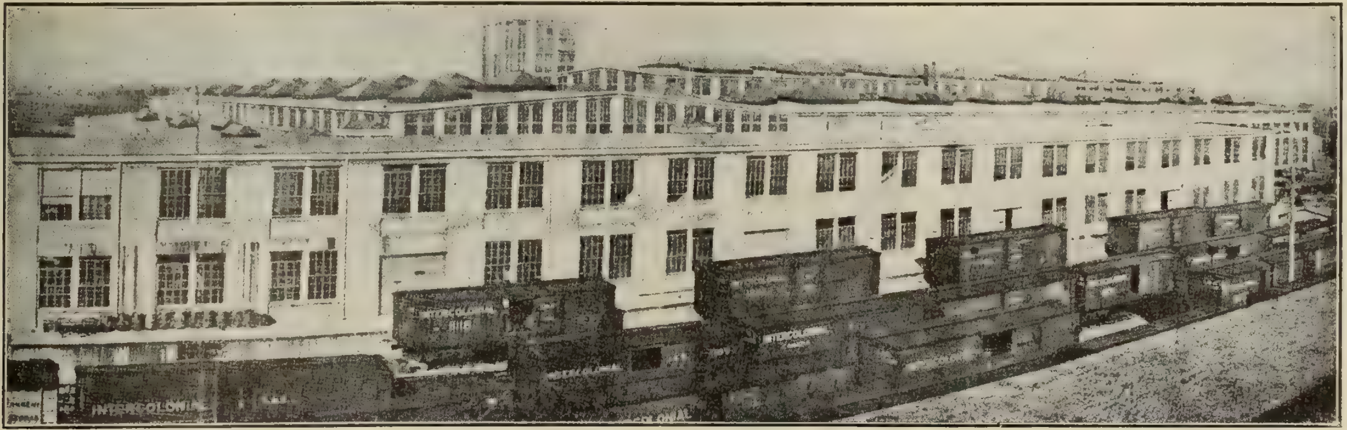


CAR SHOPS AT MONCTON, N.B., INTERCOLONIAL RAILWAY OF CANADA.

The planing mill is situated convenient to the passenger car and freight car shop. The locomotive shops comprise the machine shop and annex, boiler shop, boiler erecting shop, engine erecting shop, and smith shop, all under one roof. The four latter shops are parallel to the main line, but at right angles to the machine shop.

Locomotive Pits.

A notable feature in connection with the engine erecting shop is the arrangement of the pits. The main pit runs almost the entire length of the shop, while the track is continued across the machine and passenger car shops into the paint shop, where locomotives may be painted should the erecting shop be crowded. The side pits are all laid at an oblique angle to the main pit, and this arrangement provides greater facilities for stripping and repairing engines.



LOCOMOTIVE SHOPS, MONCTON, N.B., THE INTERCOLONIAL RAILWAY OF CANADA.

Output and Power Features.

The Intercolonial has, in addition to the large repair shop at Moncton, other shops at River du Loup and the Prince Edward Island Railway, which is a part of the Government Railways system, and operated by the same management and officials with headquarters in Moncton with large repair shops at Charlottetown, Prince Edward Island.

At the Moncton shops, the output is fifteen general locomotive repairs and rebuilds per month, and the passenger car-repairs are about 25, and the freight car repairs about 2,000 per month. Some car building is also done, about 100 freight cars per year having been turned out.

The producer gas plant supplied by R. D. Wood Co., has been shut down, as natural gas has been discovered near Moncton, and is being used in the Westinghouse gas engines, and also in all the furnaces in the blacksmith and boiler shops and brass foundry.

POWER HOUSE, SHOWING ONE OF THE 500 HORSEPOWER GAS ENGINES DRIVING 300 KILOWATT GENERATOR. I.C.R. SHOPS, MONCTON, N.B.

Power is generated by the gas engines for 1.167 cents per k.w. hour at the switchboard for operation and fuel, the cooling water forming a large part of this. The engines are giving perfect and satisfactory service, and have been in use three and one-half years, the last 9 months on natural gas.

Yards.

The yards are among the most extensive in Canada, and their construction is said to have cost more than the shops. They are divided into receiving and despatching yards, to and from St. John, Halifax, and Montreal. They cover some three hundred acres of ground, and contain ten separate yards with a total mileage of thirty-nine miles; or if laid in a continuous line, the tracks that go to make up its total would reach from Moncton Station to a point one mile beyond Sackville, a distance it takes the Maritime Express one hour and nineteen minutes to cover.

Moncton Officials.

G. R. Joughins is superintendent of motive power; G. F. Knight, assistant superintendent of motive power; W. E. Barnes, master mechanic; and H. D. Mackenzie, locomotive general foreman. We are indebted to Railway and Locomotive Engineering for the cuts and data for this article.

CANADIAN RAILWAY CLUB, MONTREAL.

AT the last monthly meeting of this club held at the Windsor Hotel, Montreal, on the evening of October 14, a most interesting lecture dealing with "Construction Work on the National Transcontinental Railway" was given by Mr. R. F. Uniacke, Bridge Engineer, N.T.R. The lecture, which was illustrated by a large number of excellent stereopticon views, was followed with close attention by a large audience.

Mr. Uniacke began by describing the methods adopted for transporting supplies for the survey and construction camps in the more inaccessible parts of the country traversed by the railway. Most of this work was performed by dog teams in winter and by canoes in summer. As was only to be expected a majority of the lantern views shown illustrated the various types of bridges on the system and the methods of erection used. Others illustrated the difficulties the engineers had to overcome owing to heavy fills and bridge abutments proving too heavy for the subsoil beneath.

A very complete description was also given of the huge car ferry now being built by Cammel, Laird & Co., of Birkenhead, Eng. This will be used for transferring trains across the St. Lawrence River until such time as the Quebec Bridge is completed. The ferry boat is to be of tidal deck type, with a rise and fall of 18 feet, which is the extreme difference in level at Quebec. The car deck will be raised and lowered by steel screws 6 inches in diameter, operated by bevel gears. At each end of the boat there is a hinged "apron" which forms a more or less flexible connection between the rails on the boat and those on shore. The apron extends beyond the end of the boat, so that latter does not have to touch the dock.

This ferry will cost about $565,000 to build and is expected to be in operation by May, 1914. On the completion of the ferry it will be used to transfer local traffic between Quebec and Levis, since the Quebec bridge is situated some six miles above the city.

At the conclusion of the lecture a hearty vote of thanks to Mr. Uniacke was passed, all present agreeing that a more interesting paper had seldom been presented before the club.

PRESENTATION TO MR. J. STANLEY COOK.

ON the afternoon of Friday, October 10, members of the Montreal Metal and Hardware Association met in the Council Room of the Board of Trade, the occasion being the presentation of a handsome silver salver and entree dish to Mr. J. Stanley Cook, assistant secretary to the Montreal Board of Trade, who a few days later was married to Miss Diemer, of Cleveland, Ohio. Among those present were: Geo. J. Crowdy, vice-president; Alex. Gibb, treasurer; W. S. Leslie, W. Starke, Jas. Davidson, W. J. Hayes, Walter Dorken, T. H. Jordan, J. H. Hanson and A. J. Wood.

The presentation was made by Mr. Crowdy, who expressed the appreciation of the Association for the numerous courtesies which Mr. Cook had extended them during past years. Mr. Crowdy also extended the Association's heartiest wishes for the happiness and prosperity of Mr. and Mrs. Cook's married life, sentiment endorsed by other members present.

Mr. Cook returned thanks in suitable terms, and expressed the pleasure it had always been to him to be able to forward, in any way he could, the interests of the Montreal Metal and Hardware Association. The marriage took place in Cleveland on Tuesday, October 14.

The Electric Furnace Application to the Steel Industry[*]

By Wilfred Sykes[**]

In our October 16 issue, an illustrated description was given of an electric furnace installation at Toronto, Ont. The present article deals with the general development, progress and future outlook for this particular apparatus, as derived from observation and results of operation of a variety of type over a wide range of product.

THE practical uses of the electric furnace in the steel industry are these: (1)—Refining steel from open-hearth furnaces or Bessemer converters. (2)—Making steel from pig iron. (3)—Making steel from scrap. (4) Making steel for castings, and (5) melting alloys for use with open-hearth and Bessemer plants.

Function of the Electric Furnace.

The function of the electric furnace in refining is to maintain the metal at any desired temperature without the necessity of having present oxidizing or reducing gases. The electric furnace does not depend, for its action, upon any characteristic of the current, its sole function being to maintain the metal at any desired temperature. When the metal is maintained in a molten state, without the presence of any gases that might affect its composition, the ordinary metallurgical processes can be carried much further than is possible in an ordinary open-hearth furnace, so that the injurious constituents, such as sulphur and phosphorous, can be reduced to negligible values. The ease with which the temperature can be regulated makes possible the production of steels that can only be rivalled by the best results of the crucible.

Keeping in mind that the function of the electric furnace is simply to maintain the metal at the proper temperature to enable the metallurgical processes to take place, it is obvious that it is much more economical to partially refine the metal in an open-hearth or Bessemer plant than to attempt to make steel from pig iron direct, as the elimination of the bulk of the impurities can be as readily accomplished in the open-hearth furnace or Bessemer converter as in the electric furnace. The final elimination of the sulphur and phosphorous is the real field of the electric furnace, in conjunction with one of the present methods of handling the bulk of the impurities.

For handling large quantities of material, it would appear that the ideal arrangement would consist of a Bessemer or open-hearth plant to do the main refining, the electric furnace being used simply for the elimination of the occluded gases and the reduction of the phosphorous and sulphur to a negligible value. With such an arrangement, the power consumption is very slow, and the additional cost of the steel can be more than compensated for by the increased market value of the product.

Arc and Induction Types.

Both the arc and the induction type of furnaces have been used for this work. The arc furnace, from the standpoint of power supply, has some advantages over the induction type. It can be used on ordinary commercial frequencies and operates with a power factor from 70 to 90 per cent., depending upon the size, arrangement of leads, etc. Its first cost is considerably cheaper than the induction type.

The induction type of furnace has a very low power factor on the usual frequency of 25 cycles for sizes over one or two tons, and it has been found necessary to use frequency changers to supply the furnace with frequencies down to 5 cycles per second for larger sizes. The first cost of the induction furnace, together with the frequency changer, is, of course, considerably higher than that of the arc type.

The arc type requires carbon electrodes, and, on account of the construction of the furnaces, the life of the furnace arch is comparatively short, due to the intense radiation from the arc. The furnace cover is usually made removeable and it can be replaced in a short time. The life of the remainder of the lining is comparable with that of the open-hearth furnace. The difficulty of making large electrodes, 18 in. to 24 in. in diameter, such as are required for furnaces of 10 to 15 tons capacity, leads to excessive consumption, due to the poor quality. The mistake has been made of increasing the current density in some of these furnaces, so as to use smaller electrodes, but such an expedient leads to greater electrode consumption.

The electrode consumption is a very important item in the cost of steel production. In some of the earlier experiments made in the United States, the cost of electrodes varied between $2 and $3 per ton of steel produced. This figure has been reduced, due to the experience gained, but, even at present the electrode consumption of a 15-ton furnace is approximately $1 per ton of steel produced, and it is not anticipated that this cost can be reduced below 75c. per ton of steel.

The absence of electrodes in the induction type of furnace is a very important advantage, and the absence of the intense radiation of the arc enables the lining of the furnace to be used for a much longer period than is possible with the arc type. Records have been obtained from induction furnaces showing a lining life up to 500 charges, which is many times in excess of what can be obtained with the arc type. The induction type of furnace also has a thermal efficiency of approximately 10 per cent. more than the arc type. This is, however, probably offset by the loss in the converting machinery required to give the low periodicity for this type of furnace.

Both types of furnaces are in practical use for the final refining of steel, and from the standpoint of the quality of material obtained, neither type seems to present any particular advantage over the other. It might be mentioned that the construction of the arc type of furnace is preferable from an operating standpoint, as the slag is readily formed over the whole at the surface of the metal, and it can be more easily removed than is possible with the induction type, which has a comparatively small surface area in the form of rings around the transformer coils.

Making Steel From Scrap.

The electric furnace is used to some extent for making quality steel from cold scrap, and the arc type has been largely used for this purpose, due to the fact that no special arrangements are necessary to enable it to start with cold material. The field for this quality of steel can be seen from the following statistics of crucible steel production in the United States:

	1911, tons	1912 tons
Crucible steel ingots....	83,623	100,967
Crucible steel castings..	14,050	20,550

All this steel could be produced in electric furnaces if necessary.

The induction furnace must be started with a cast or welded ring in the metal trough, as satisfactory results have not been obtained by simply piling the scrap together. After the induction furnace is started, when using cold materials, only two-thirds of the charge can be poured, as one-third must be kept always in the furnace for starting the next heat. The electrode consumption of the arc type, when operating under such conditions, is very high, due to the time each charge is in the furnace, the electrode consumption being a function of the time the furnace is in use. The quality of material produced by the electric furnace using cold scrap is at least equal, if not superior to, that produced in crucibles, and in Europe such furnaces are being used to a considerable extent for the production of fine grades of steel.

---

[*] From a paper read recently before the Association of Iron and Steel Electrical Engineers in New York.

[**] The Westinghouse Electric & Mfg. Co.

At the present time it is hard to say which type of furnace is considered the better for this work, as both types are used to about the same extent, but the convenience of the arc type in starting is an important consideration. The time per charge for the melting and refining is about 6 hours. It might be mentioned that the largest crucible steel manufacturer in America has recently installed an electric furnace for the production of crucible quality steel. The field is a fairly large one, as the production of crucible steel in 1912 was 121,000 tons, all of which could have been furnished by electric furnaces if necessary.

Steel for Castings.

One of the most promising fields for the electric furnace is the making of steel for high grade castings. A great deal of work has been done along these lines in Europe, and one or two concerns are using electric current for steel castings in this country. There is no doubt as to the field for small castings, providing a quality can be produced that has the qualities of good open-hearth steel. In 1912, 20,000 tons of crucible steel castings were made, and the electric furnace would have been able to produce the required quality of steel at much lower cost.

Up to the present time, the electric furnace has been used only for the production of comparatively small castings, but with the development of this trade, there is no reason why large castings, requiring high quality, should not be produced. The quality of castings produced is equal to those made by the crucible process, and naturally, the cost of production is considerably less. It is to be anticipated that, in the future, electric furnaces will be installed in our largest steel plants, for the melting of the alloys used in the production of steel. The induction furnace is probably the most desirable for this work, and this furnace load may be a factor that will be of interest to the engineer in charge of electric installation.

Arc Type Furnaces.

The earliest practical furnace was the Heroult, and, up to the present time, this type is still in the lead, as far as the number of installations is concerned, and capacity. With this type the arcs are in a series, and it gives the best electrical characteristics of any of the arc type. The voltage varies from 80 to 100, and the power factor from 70 to 90 per cent. on 25 cycles, depending upon the capacity of the furnace and arrangement of the leads. All furnaces of the arc type are open to the objection that the input fluctuates considerably, especially if started with cold material. When starting a furnace cold there are frequent short circuits, the current being only limited to the reactance of the furnace. In some respects, therefore, it is an advantage to have the furnace so arranged that the power factor is comparatively low, as this reduces the shocks on the power plant. With a large furnace, of say 15 tons capacity, the input will vary from 0 to 100 per cent. overload almost instantaneously. When the furnace is only used for molten metal, the fluctuations are not so great, but, even under these conditions, the power will vary from 50 per cent. of full load to 50 per cent. overload instantaneously.

The only other representative of importance of the arc type is the Girod furnace. This furnace has a single electrode, the current being conducted through the bath to the bottom of the furnace, which is connected to the other side of the line. Due to the fact that this furnace has only a single arc, the current required is greater, and, consequently, as a rule, the power factor is considerably lower than that of the Heroult type. To get the same power into the furnace, approximately twice the current is required, and consequently the difficulties experienced with the electrodes are very much increased. It has been the practice of Girod to use a higher current density than is adopted in the Heroult type, and consequently the electrode consumption is considerably greater, the best figures averaging at least twice those obtained with the Heroult furnace.

Induction Type Furnaces.

Of the induction furnace, the principal representative is the Roechling-Rodenhauser. This type is really a combination of induction and resistance furnace, and has been designed to work on a commercial frequency. On 25 cycles, the power factor of this furnace is comparatively low, not exceeding 50 per cent. with a furnace of eight tons capacity. For a large furnace it has been proposed to use lower frequencies, down to about 10 cycles per second, in order to obtain reasonable operating characteristics. This necessitates a frequency changer, which, on account of the special characteristics, is necessarily expensive At 10 to 15 cycles per second, its operation, however, would not be prohibitive.

The next important representative of this type is the Frick furnace, which has been used to some extent in Europe, and has been strongly advocated by its builders. From an operating standpoint, it presents a number of advantages, not the least being that the surface of the metal is horizontal, which is not the case with other induction furnaces, and consequently the amount of slag required to cover the surface of the steel is less. An undesirable feature is the very low power factor, which requires an extremely low frequency to make the furnace at all operative. For instance, a 20-ton furnace operating on 5 cycles has a power factor of only 50 per cent. and cannot be operated at all on 25 cycles. This is a very great drawback to this type, as special generating or converting equipment is required, the expense of which very greatly increases the cost of the equipment.

It appears that an ideal induction furnace is yet to be produced. The necessity of having some special generating or converting apparatus for large induction furnaces greatly restricts their usefulness, and for this reason the arc furnaces are used wherever possible in preference to the induction type. In the smaller sizes, the induction furnace can be used on 25 cycles, and they seem to present advantages over the arc type.

Future of Electric Furnaces.

During the last five years, the production of steel by electric furnaces in the United States and Germany, which countries are the principal producers, has been as follows:

Year	United States	Germany
1908	55 tons	19,500 tons
1909	13,762 tons	17,700 tons
1910	52,141 tons	26,200 tons
1911	29,105 tons	60,600 tons
1912	18,309 tons	74,200 tons

From this table, it can be seen that the production has greatly decreased in the United States during the last two years. This is, to some extent, due to the business conditions existing in the steel industry, and also to the desire to find out what results could be obtained from the rails that were made from electric steel in 1910.

Several years ago a quantity of rails were made in Germany from electric steel, but they have not yet been in use long enough to determine whether they are sufficiently superior to the ordinary rails to warrant the additional expense. For this reason, the progress in Germany has been slower than has been anticipated, the production of electric furnaces being mainly confined to high grade alloy and crucible steels. There seems to be little doubt that in time electric furnaces will supersede crucible in the production of high-grade steel. It will also be used to a considerable extent in the production of high grade castings, especially small castings, such as are used for automobiles, etc.

It is apparently an open question whether the electric furnace will be used at all for the production of rails and structural material. If it is not, then the field will be necessarily restricted to a comparatively small production. If it finds general use in the production of rails and structural material, then the electric furnace will become the most important piece of apparatus in the steel mill, and the characteristics outlined in the foregoing will present the problems of the first magnitude.

BUSHING GRINDING WHEELS.

WHILE it is of the utmost importance that grinding wheels should be properly bushed, very crude and inefficient methods are in use in many places, and it is not surprising that grinding wheel troubles result.

The suggestions given are based on the bushing methods in vogue at the Norton plant. The first requisite for bushing wheels is a chuck in order that the hole may be centred.

Bushing Material.

Lead can be judged by the color. Soft pig lead has a greenish purple tinge when hot. This is too soft for the bushing to retain its shape, and it will not stand careless handling when placed on a machine spindle. Frequently, the complaint that a wheel is "out of truth" is caused by the bushing being too soft. The lead, when hot enough to bush with, should be of a grayish color.

Babbitt is a much harder material, and, therefore, better adapted for bushing cup wheels with large overhang. Very coarse wheels that are subjected to hard pressure on the periphery stand up much better if bushed with babbitt.

Position.

One should be careful to see that the wheel lies flat on the bushing chuck; then move lever on chuck until the wheel is gripped tight, being careful to see that you do not raise the wheel from the chuck, otherwise you will have a lot of lead on the under side of the wheel.

It is advisable to remove the blotters from sides of wheel before bushing, but if you do not care to do that, make a paper collar the same thickness as the blotters, and small enough to go inside of hole in blotters and fit on the arbor. This will keep the new lead bushing even with the old one, and will save trouble with wheel running out on the sides. It is also advisable to put two or three notches in the old bushing, with a hammer and chisel, to make the new lead unite more securely with the old.

Operation.

First get the arbor of the size you desire to use and see that it fits in taper hole of chuck. After you are satisfied it fits, take out arbor, place wheel flat on chuck and move lever until tight. Then put in the arbor, slip the bushing cleaner over the arbor, holding it down firmly on the wheel. Fill the ladle with lead and pour it through cleaner hole into the wheel. Let it cool half a minute, turn the cleaner so as to cut off pouring tap, take off the cleaner, remove wheel from chuck and rest it on the floor or bench while you drive out the arbor. It is important that the lead bushing does not protrude outside of the wheel. It is, therefore, necessary to trim off the bushing with a chisel even after a cleaner has been used, as the lead will sometimes be above the side of the wheel.

Avoiding Trouble.

When the wheels are not properly bushed, they will run out of truth on the sides, which indicates that the hole is not at right angles with sides of the wheel. In mounting the wheel, a careless operator might not notice such a condition and tighten the wheel up against the stationary flange on his grinding machine spindle. Usually this breaks the wheel, but if it does not, the wheel is very liable to break when it comes in contact with the work. It is more dangerous when the wheel does not break when mounting, as placing it in contact with grinding work places extra strain on it, and the wheel breaks when revolving.

Another cause for breakage at times is that the bushing is left sticking out on the sides of grinding wheels. If they are mounted with lead bushings protruding, pressure on the lead, when the wheel is tightened in place, is sufficient to break wheels, or put such additional strain on them that they will break later while in use.

Sometimes, when wheels are piled one on top of another, a protruding lead bushing in the pile will cause such a strain from weight of wheels on top, that a soft or thin wheel will break under it.—Grits and Grinds.

PORT ARTHUR GOING AHEAD.

THE following figures show the amounts of grain shipped on vessels since the opening of navigation from the three elevators in Port Arthur, as compared with the same period of last year; the increase being twenty-five per cent.

	1912.	1913.
Wheat	13,985,360	13,684,115
Oats	4,585,670	5,605,575
Barley	591,405	1,655,785
Flax	1,918,650	3,413,830
Screenings.. .	4,950	108,635
Totals	19,366,035	24,467,950

The figures do not include the quantities loaded in the vessels wintering here, as there were about five million bushels loaded during last winter as against 1,500,000 loaded the previous winter.

AN OLD LANDMARK SOLD.

THERE will pass under the hammer on November 13th, the foundry of the Star Iron Co. at Beauharnois, Que. This is one of the oldest foundries in the Province of Quebec, having been in operation since 1878. Its principal product is the "STAR" boiler for hot water heating purposes. This boiler has long been a general favorite, there being, it is said, more than 6,000 of them in use in the city of Montreal alone, besides numbers scattered throughout the provinces of Quebec and Ontario. The supply of grate bars and other spare parts for boilers now in use would, it is expected, be quite a profitable business, and the foundry will doubtless realize a good price at the sale, which is to be held in Montreal.

BOAT BUILDERS ORGANIZE.

THE Canadian Association of Boat Manufacturers was organized at the Prince George Hotel, Toronto, on September 30, when two sessions were held and a committee was struck for the purpose of preparing the way for a motor-boat exhibition to be held in Toronto February 21 to 28 next. The objects of the association are to promote a fraternal spirit among boat manufacturers, eliminate unpleasant features of competition, and encourage higher standards of efficiency in boat building generally. The membership of the association will include boat manufacturers, marine engine manufacturers and naval architects. The headquarters will likely be in Toronto.

The officers elected are as follows:—President, H. Pitchburn, Gravenhurst, Ont.; First Vice-President, H. W. Going, Brockville, Ont.; Second Vice-President, Hugh M. Warnocker, Penetang, Ont.; Secretary, Adam F. Penton, Toronto; Treasurer, Claude H. Rogers. Executive Committee—M. M. Butler, Brighton; John A. Robinson, Toronto; H. L. Bastian, Hamilton; Fred Gilbert, Brockville; J. H. Roff, Orillia; J. W. Stone, Kenora, Ont., and A. L. Beaudry, Montreal.

Drill Jig and Fixture Design and Construction

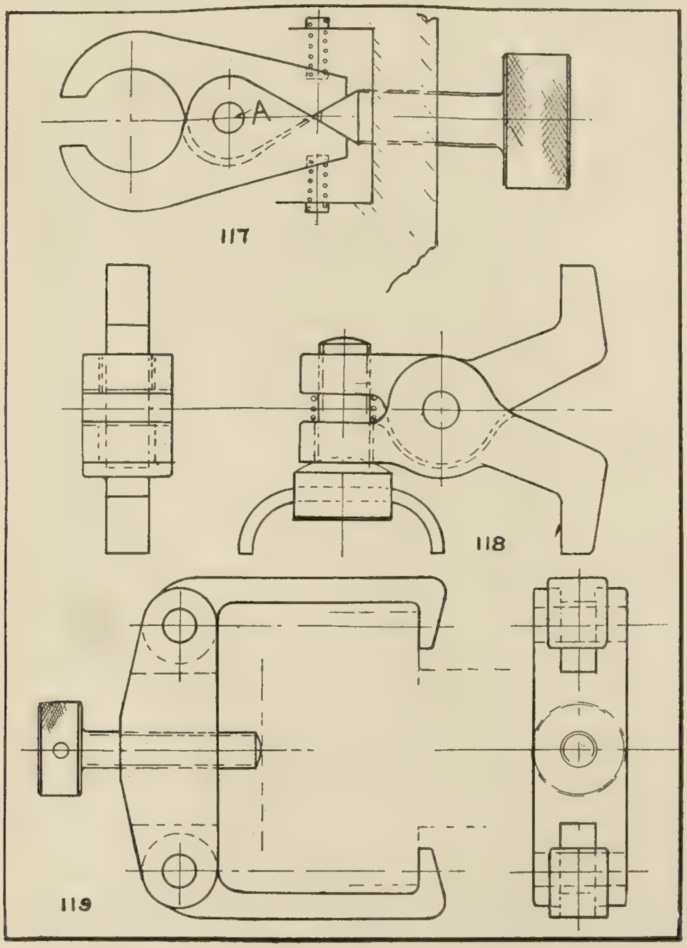
By H. R.

The sketches and data will, the writer hopes, appeal to machine shop superintendents, designers, toolmakers, and novices, as indicating the large place jigs of every kind and for every service occupy to-day in machine shop practice.

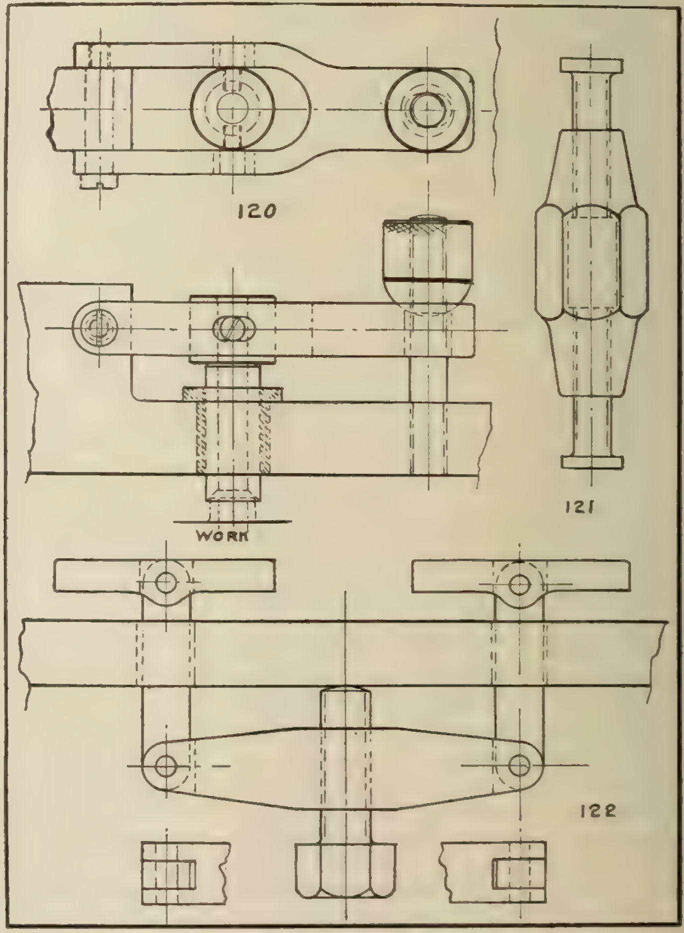
If a jig and fixture designer were asked, what is the difference between a jig and fixture? it is very probable that he could not make clear a distinction. To properly define the jig apart from the fixture is a very difficult proposition. The word jig is frequently used to denote almost any work holding appliance used in the manufacture of repetition parts. This is the same as the word fixture when used for all kinds of special tools. It can be positively stated that a jig is a special tool used in the manufacture of repetition parts while it accommodates the work or is held on the work, at the same time containing guides for the various tools that are to operate on the component, whereas a fixture is simply for holding purposes, or a manufacturing base for the work to be held upon, while the cutting tools are performing an operation, without having any special means for guiding the tools. The fixture, therefore, must be securely held to the machine table on which the operation is to be performed, and it may be provided with any number of stops or gauging pieces, although not containing any special arrangements for the guidance of the tools in operation. This explanation would define jigs as tools used exclusively in drilling and boring operations. Fixtures would be those tools used on milling machines, broaching machines, slotting machines, planers, shapers and grinding machines. Of course, tools for holding work on lathes are generally a combination of both.

A few general remarks on the principles of jig and fixture design will not be out of place. One big mistake quite frequently made is giving too little clearance between the piece to be machined and the sides of the jig. It is, therefore, as well to allow as much clearance as possible, and this should be particularly noted when rough castings or forgings are to be drilled or machined in the jigs. Sometimes surfaces which don't actually bear upon the work do not agree with the dimensions on the drawing. Particularly, therefore, in a cast iron jig should these allowances be taken care of. With regard to the locating points, it should be understood that in all instances these should be visible to the operator when putting the work into the jig; this will enable him to see that the work is in its correct place. Sometimes the design of the component to be operated upon prevents the locating points being readily seen. In these particular cases, a cored or drilled hole near to this point will enable same to be visible, thus giving the operator a chance of seeing if the work is resting on its proper place. Another point that should not be overlooked is that the swarf or chips are able to fall clear of the jig or fixture, or if it is not possible for them to fall clear, to make provision for them to be easily cleaned away.

The points so far referred to have been in relation to the holding feature, and the design in general for producing accurate work. Provision should also be made for clamping large jigs to the table of the machine on which operations are to take place. Small drilling jigs, for instance, are not clamped to the machine, but boring jigs and milling fixtures invariably have to be secured to the machine on which they are employed. Methods of securing these will



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.

be illustrated. When jigs are made, it should be thoroughly understood that they must be finally tested for accuracy in the tool room, so as to determine if everything is in perfect order. This has particular reference to the locating points. Another feature usually overlooked is that when the work calls for great pressure on the clamps, and it is necessary for nuts and bolts to be used, there are sometimes several sizes put into the jig or fixture. This retards quickness of production from the operator's point of view, when he has to find several sizes of wrenches, to suit the various nuts. It should be aimed at, if possible, to work into the design of the jig all one size of nut, and it may be found necessary to re-design some jigs several times before producing a simple and satisfactory form. We can set down a few hard and fast rules on the principles of jig and fixture design, as follows:—

1.—Before planning the design of a jig or fixture, compare the estimated cost of production of the work with the present method of manufacture, making allowance for the outlay on the necessary equipment.

2.—Before laying out a jig or fixture, first decide on the locating points, and thoroughly fix a clamping arrangement.

3.—It is essential to make all clamping arrangements as quick acting as possible; this will save considerable time and money.

4.—Make the jig fool-proof, which means that you design the jig or fixture so that it is impossible for the component to be inserted wrongly.

5.—It will be found necessary to make some of the locating points adjustable on rough castings. Locate clamping devices in the best position to withstand all pressure of tools, and avoid all complicated arrangements which are liable to get out of order.

6.—Set all clamps, if possible, so that they do not project outside the jig; in other words, make the jig as compact as possible.

7.—Another important point is: Reduce the weight of the casting or jig as much as possible by cutting out unnecessary metal consistent with rigidity and strength. Do not forget to round off all corners, as it will save the operators many cuts.

8.—Provide all conveniences to facilitate handling the jig or fixture.

9.—Provide feet either formed out of the casting, or feet of steel case hardened, fitted into the jig, preferably four. This ensures a small true surface on which the jig will always be square.

10.—In all cases where there is a great amount of wear, such fittings as clamps, screws, nuts, studs, etc., should be case hardened. This will lengthen the life of the jig.

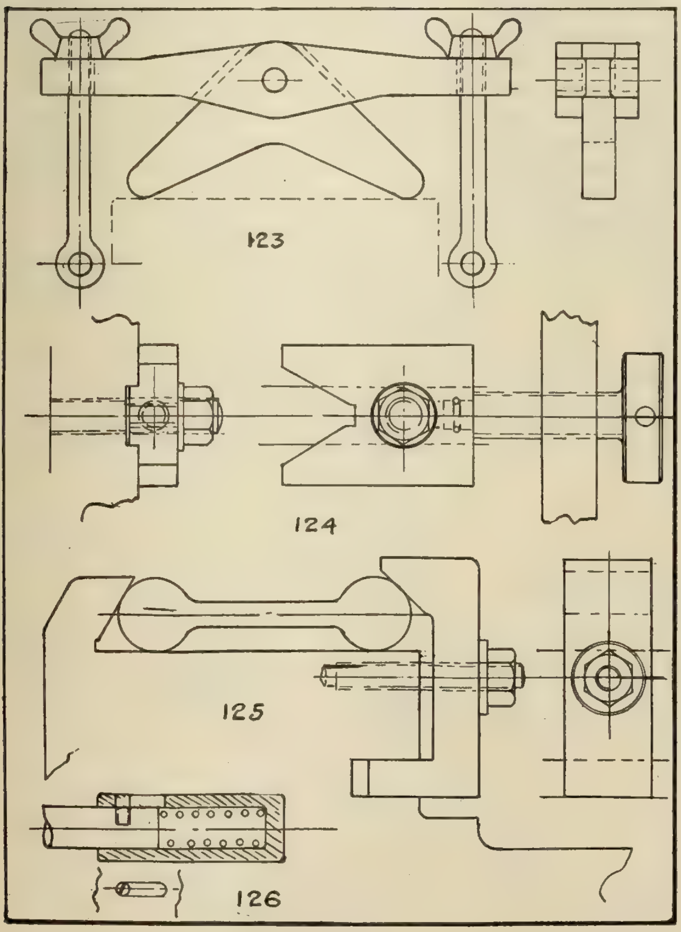
11.—Never drill the table of a machine to accommodate the holding down of jigs; always use (C) clamps, if slots are not provided.

12.—Provide the best means of clamping down the jig or fixture so as to prevent springing on all tools that must be held to the table of the machine while in use, and slots for keys for all milling, planing and boring fixtures, and spigots for lathe fixtures.

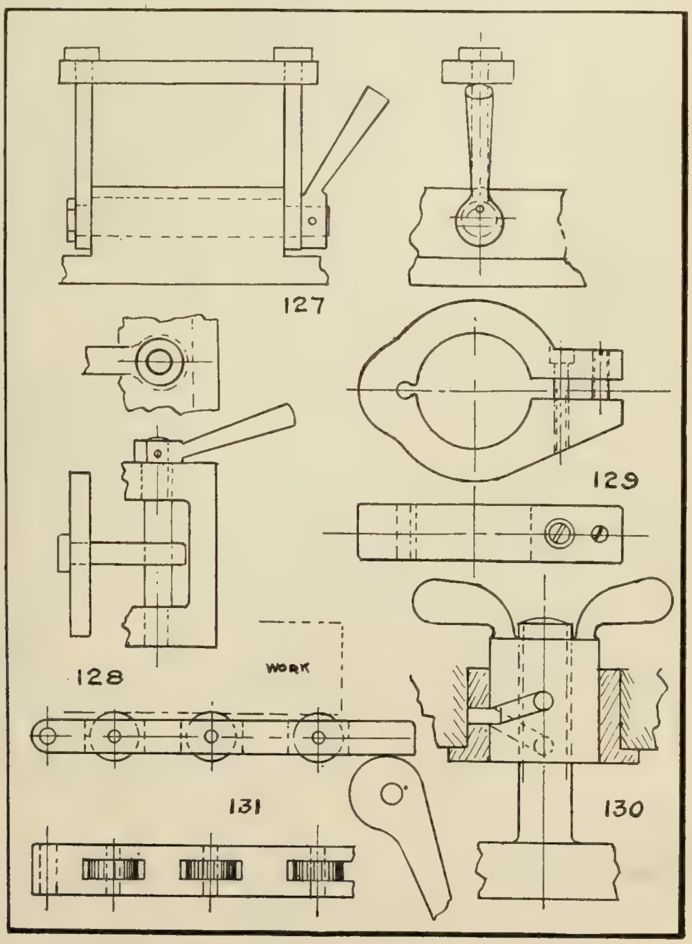
There are many useful methods still for me to describe in the way of clamping devices. Illustrated in Fig. 117 is an arrangement for clamping work that cannot be done by using the ordinary strap and bolt. Two levers or a pair of levers are fulcrumed at (A). It will be readily seen that by adjusting the screw, the taper portion tends to expand the ends of the levers inwardly. To reverse the action of these levers, the coiled springs act against the sides of the levers as the screw is reversed.

Fig. 118 shows a very complicated set of outer grip levers, in which the action of a coiled spring reverses the action of the levers, as in Fig. 117.

Fig. 119 depicts two swinging grip arms that are pivoted on a cross bar, which has the adjusting screw or the pressure appliance. It is most essential that the pivots or fulcrums of the out-



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.

side arms should be in the direct line of pull, or it may be best to keep this line of action 1-16 in. inside. If this be made outside, the levers will expand outwardly to the line of action.

Fig. 120 shows what is termed a lever sliding bush, in which the work is held down by a bush, and is operated through a pivoted lever and pressure applied by means of a thumb nut. It will be seen that this is a quick operating device, and better than a screw-down bush, but it is rather expensive to manufacture, as it is necessary to have a long bearing for the bushing.

Fig. 121 shows a good way of taking the strain of the drill on a forked casting. This device has an adjusting hexagon nut with right and left hand threads, so that by turning the nut, the end pieces will expand. This jig will be found suitable for other work also.

Fig. 122 shows a combination of levers that are all operated by a screw. It is sometimes possible to arrange such a set of levers, and thereby save a great amount of time in clamping work.

Fig. 123 shows what is called an equalizing clamp or lever, which will be found very serviceable in work which has two bearing surfaces. It will be readily understood that there will be an equal amount of pressure on each end of the lever, even though the wing nuts may not be tightened exactly alike. In this arrangement the centre pin takes the full load or clamping strain, and should be, therefore, designed accordingly. The strap which is weakened by the slot should be thickened up as indicated.

Fig. 124 shows an adjustable vee clamp, adjusted on a tongue or key. An elongated slot in the centre accommodates the holding down screw, and constitutes a very good arrangement, the advantage being that when the vee block has been finally adjusted to the piece it can be held securely by tightening down the nut.

Fig. 125 shows another clamping device that may be useful. It will be seen that the work is not only clamped down by this method, but is located at the same time by the angle portions. The adjusting clamp is held square, and is kept from twisting by its opposite end.

Fig. 126 shows what is generally termed a spring stop, which will be found useful for locating work. In the last article I described cam levers.

Fig. 127 shows a double eccentric clamping arrangement, where the cam principle can be adopted. It consists of an eccentric shaft which takes its bearing in the centre, while the eccentrics are formed at each end, thereby operating two rods which gives them an even pressure. This clamping method is quick in its action, and can be thoroughly relied upon. The throw of the eccentrics may vary according to the work on which it is employed, being generally about 1-16 to ¼ of an inch.

Fig. 128 shows another arrangement which acts just as well as Fig. 127 for its particular work.

Fig. 129 shows a clamping ring which may be adopted under some circumstances.

Fig. 130 shows a good arrangement that will act on two surfaces.

When a large component is very heavy, it will be well to adopt the arrangement shown in Fig. 131, if at all possible, as by two or more of these combinations of rollers and the cam lever the work can be taken out of the jig with little exertion. This method can be employed on many drilling machines, especially the large types, and will soon save the expense of their being installed.

READER, WHAT DO YOU KNOW?

Among readers of Canadian Machinery there is a clearly defined sincerity of desire to know how each overcomes the daily tasks of the machine, pattern and blacksmith shops, the foundry and boiler shops. It is believed that your methods and devices, while good, may be improved, and thereby made more valuable if you publish them, so that other brains may work on them. We will provide the setting and pay you for the material. When your fellow tradesman puts the superstructure on your foundation, we pay him and pass the "kink" on to you, free. Get into the game.

◆

HINTS FOR YOUNG PATTERN-MAKERS.

Be proud of your craftsmanship, prouder still of your craft; and uphold the dignity of both.

"Tearing it off," is the indulgence of the exceedingly skilful, or the very foolish.

"The race to the swift, to the victor the crown." True! but in pattern making, swift races should not be entered until the training is perfect and the practice sure.

Ambition begets perseverance; but should be leavened by reason.

Method is the first cousin of efficiency.

To read a drawing is, for a pattern-maker, not sufficient, he must visualise it.

Looking and seeing are both distinct and different. You "look" with the eye, but "see" with the brain; make sure you see through the drawing before you start the job.

The setting out of a job need not be a picture; but it must be a neat accurate working drawing.

All lines in a setting-out should be scribed, not pencilled; the latter are easily erasible, and being of vague and varying thicknesses are not conducive to accuracy or permanency.

Work to the dimensions given on a drawing, not to the scale. Print paper shrinks, and while a draftsman need only be "near enough," your work must be "IT."

A slave to custom can never be the servant of progress.

A "lagged-up" job saves weight and material; also if well made is as desirable as a solid pattern.

Circular end blocks for lagging allow any width of material to be used, but this advantage is offset by the more expensive circular fittings of the lags to the end blocks.

Polygonal end blocks require material of equal widths, but are an advantage,, as the joints, being flat, are more quickly formed.

Polygonal end blocks should be worked altogether, as one whole. This keeps all the flats and angles in perfect alignment.

Because wood is common, it does not follow that it is cheap.

A **plank** in hardwood is any "stuff" upwards of 9 in. wide and 1¾ in. thick. In softwood, upwards of 10 in. wide and 2 in. thick.

A **board** is less than 2 in. in thickness, but over 6 in. in width.

A **batten** is between 1½ in. and 2 in. in thickness, but less than 9 in. in width.

A **deal** is over 2¼ in. thick; but less than 10 in. in width.

Quartering runs from 3 in. by 3 in., up to 4½ in. by 4 in.

Quartered planks are planks cut radially to avoid "casting," and although the most costly form of timber, they are the most economical for forming standard patterns. — Foundry Trade Journal.

WHEEL MOLDING BY MACHINE.

By H. Roberts.

SINCE the introduction of the molding machine, great things have been accomplished in its rapid development through careful study and experiment by manufacturers. It is quite safe to say that there are few things that cannot be accomplished in the way of molding on modern molding machines. Wheel molding or toothed gears can now be done with ease and accuracy. With a molding machine the cost of expensive patterns is eliminated, which means that with a molding machine a part of a pattern is all that is needed for a toothed wheel. With the employment of machine mechanism more accurate results are produced in the spacing of the teeth than can be produced by hand work with a complete pattern. The toothed wheel molding machine has a complete dividing mechanism, which is operated by a complete set of change wheels, etc., for the spacing of the teeth, and with other arrangements of gears for withdrawing the tooth block pattern. Of course, the necessary cores are generally made on another machine or by hand. These are afterwards inserted into the mold by the molder.

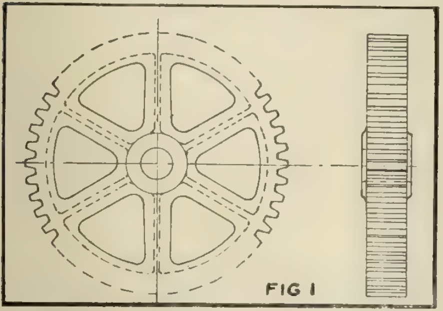

FIG 1

WHEEL MOLDING BY MACHINE.

The general procedure adopted to produce a successful mold is as follows:—The operator or molder is provided with all the necessary parts, such as tooth block patterns, striking boards, etc., which, of course, vary with the size or type of wheel to be produced, whether bevel, worm, spur, etc., and the design of the arms and shroudings. The illustration shows the molding of a plain spur gear, which has a plain top. The top box is rammed separately from the wheel mold upon a level sand bed. If the wheel be of large size, it will have to be made in the floor sand. A coke bed is made underneath, so that the whole of the wheel can be well vented in this bed. Small wheels are made in a bottom and top box. In the case of the spur wheel shown in Fig. 1, the bed and top joint face are made with a striking board, Fig. 2. On this board the half section of the wheel is marked so as to be a guide for the molder for setting the cores into the mold. This board is attached to the striking centre or bar (A) by a forged strap (B),, which can be adjusted on the bar by the set screw (C). The board strikes the face (D), the top joint face. The bottom of the bed (E) and (F) form a wall of sand at 3 inches away from the tooth point, leaving a space (G) for the facing sand. This is rammed within and around each tooth space. In the molding of bevel wheels it is much better to cut the board exactly to the diameter of the tooth points and the bevel.

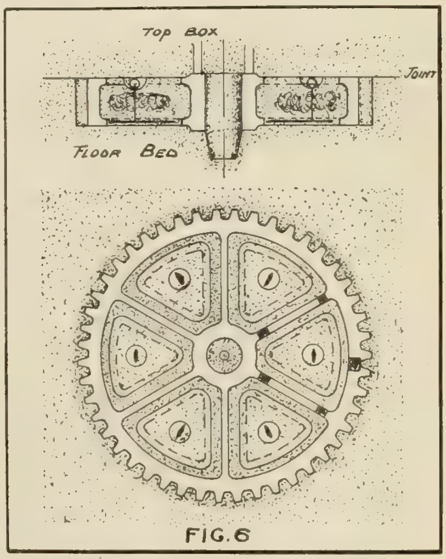

FIG.6

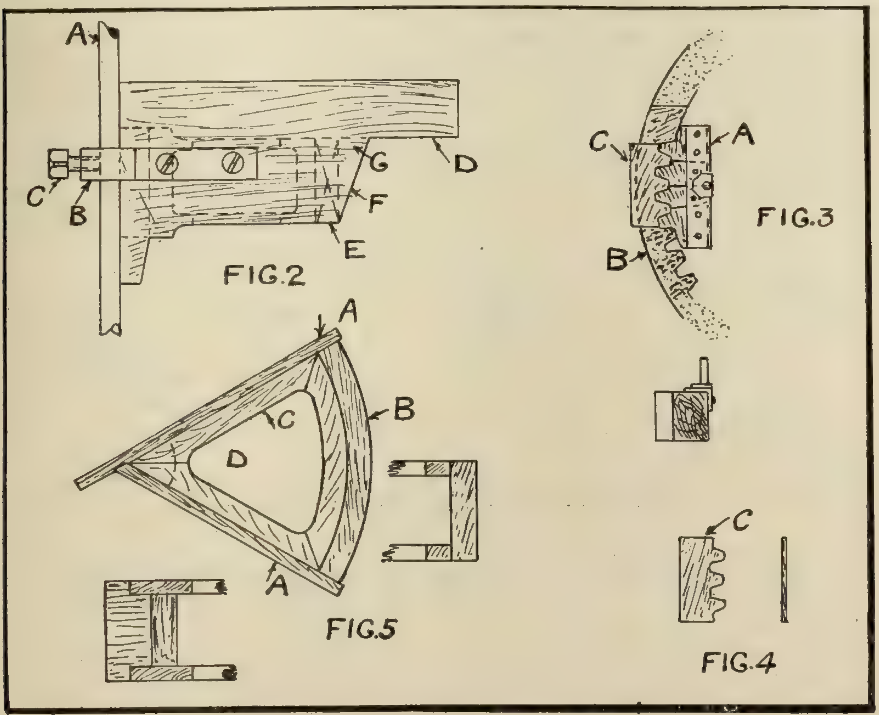
WHEEL MOLDING BY MACHINE.



WHEEL MOLDING BY MACHINE.

To Form the Teeth.

The ramming of the tooth block (A), Fig. 3, follows. That illustrated has four teeth, but many contain more or less. It is as well to say here that the more teeth employed, the greater the accuracy demanded, because each tooth space must be a facsimile of its fellow. Each space has to be rammed up with the same precision and labor as any other, so that the only time saved is that of elevating the block. Using a tooth block, the spur shown on a bevel wheel block is bolted to the carrier of the machine, and the radius is set or determined by means of a strip cut to extend from the central striking point to either the root or point of the tooth, and the arm is permanently held by the set screw (C) in the position corresponding therewith. The block is lowered by means of the vertical slide of the machine until it touches, and then just presses upon the bed struck by the board, Fig. 2. After this procedure the ramming-up commences.

The ramming-up must be done carefully, so that the connection between the tooth spaces and the outer body of the wall of sand struck or formed by the sloping edge of the board, Fig. 2, shall be complete. There will then be no risk of the narrow streaks or pieces of sand in the tooth spaces being washed away. This is prevented by the use of nails, several being rammed in along with the sand, thus forming a bond of union. Facing sand is rammed inside the teeth to the thickness of about 1½ inches, with black sand behind. A block on one side keeps the sand from being rammed there. The tooth block is lifted by the vertical arm of the machine, while the sand is prevented from pulling up by holding a flat piece of wood (C), Figs. 3 and 4, on its surface. It is then moved a distance equal to the pitch by the dividing apparatus of the machine and lowered and rammed.

Method of Forming the Arms.

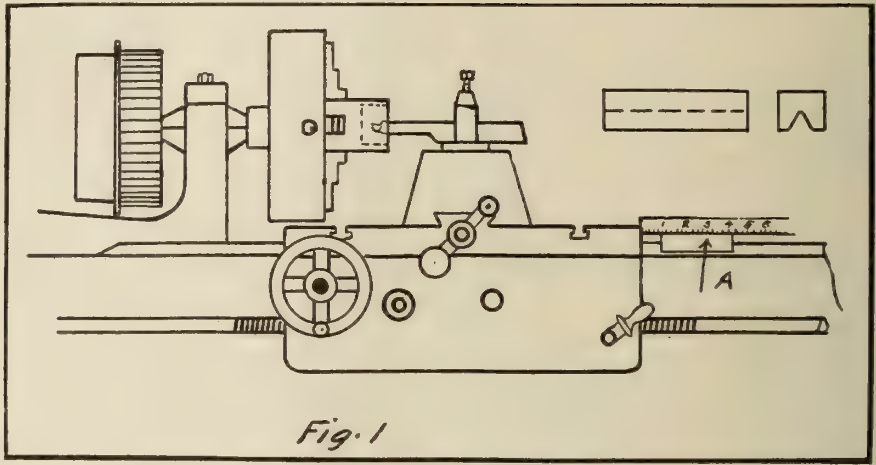
There are many different methods of formation adopted for spur wheel arms. The H section is the most common of all, because it is the easiest to make, and probably the strongest. Other forms are of course adopted, such as oval and cross section, etc. The core box is made of the form illustrated by Fig. 5 in the plan and part sections. The two sides (A) are notched together at the angle required for the arms, 60 degrees being the angle for 6 arms, 90 degrees for 4 arms, and 45 degrees for 8 arms. The inner faces correspond with the centres of the ribs, and the thickness of the ribs is equal to half the thickness of the arms. The inside of the sweep (B) corresponds with the inside of the rim of the wheel, while the flat arms (C) and the inner ribs (D) are divided to allow of delivery of the core. The core is rammed up, and the screws which connect up the sides of the sweep are withdrawn. The sweep (B) is drawn away horizontally, the sides being drawn away in the same manner, and the core left on the ramming board or bed. The finished mold is shown in section, and the plan in Fig 6, and indicate clearly the relations of the various parts. It should be clearly understood that, when setting the cores, great care must be taken in gauging the thicknesses of the arms and rim.

The full advantages of machine molding are most apparent in patterns of very intricate form, which involve more of the molder's time in sleeking and shaping of joint faces, and more work in the cutting of runners, etc. The highest economies are obtained when patterns of small or medium dimensions are grouped on plates with the necessary runners, and when joint faces are not plain. Patterns which are not cored, or one cored only very little, are more economically molded than those in which many intricate cores have to be fitted and properly secured. It is evident that shallow patterns and those without vertical edges produce the best kind of a mold. Deep patterns with vertical faces are better adapted for plate or machine molding when a stripping plate is employed.

SOME USEFUL KINKS.

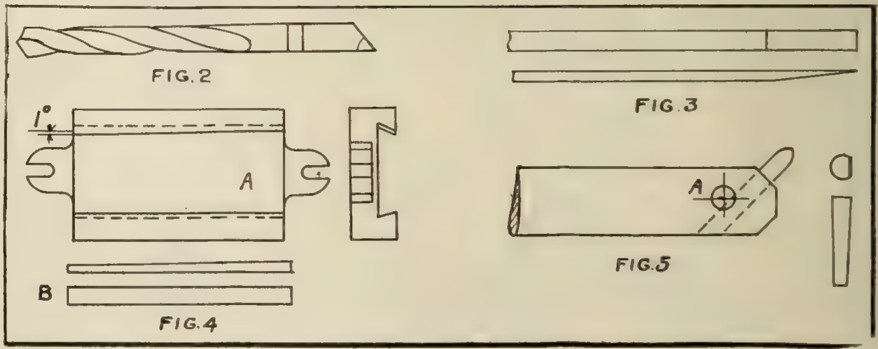
By C.E.M.

TO plane up a Vee Block to fit the ways of a lathe and to square both ends. When boring a recess a certain depth, place the boring tool against the outside face of the work and lay the vee block on the ways against the saddle. Bore the recess and measure the depth between end of vee block and saddle as indicated at A, Fig. 1. When "measuring back" for long threads, and when marking crank pin centres on multiple throw crank shafts, etc., the same method works equally well.



SOME USEFUL KINKS.

(2) It is often necessary to lay out a hole through one which is already tapped. An ordinary scriber is not satisfactory for this work. Take a twist drill, grind the shank as shown in Fig. 2, and put it through the tapped hole and turn it around. This gives a clear line, true with the bottom of the thread.



SOME USEFUL KINKS.

(3) Fig. 3 shows a scriber which will be useful for operations where a round scriber would not be suitable. As one face is perfectly flat, a line may be scribed very close to the straight edge, or it may be laid on a parallel and a line scribed even across an open face.

(4) Dies are usually held in cast iron shoes (A) by set screws, but a much better method is shown in Fig. 4. One side of the opening for the die is planed parallel with the casting and undercut as desired. The shoe is then "thrown around" about 1 degree and the other side undercut at the same angle. The gib B. Fig 4 is planed to the same taper as the shoe, and such a size as to fill the space between die and shoe. The dies, which are parallel, are placed in the shoe and the gib driven in. By this method the die is held more securely than with set screws, is far easier to loosen and is more durable.

(5) The following is a good method for holding a cutter in a small boring bar. A round or square cutter can be used, as desired. If a round cutter is used one side must be slightly flattened. Drill the hole (M) as indicated in Fig. 5. Make the locking pin a sliding fit in the hole (A), file one side flat and slightly tapered so that when driven tight against the cutter, the ends come nearly flush with the outside of the bar.

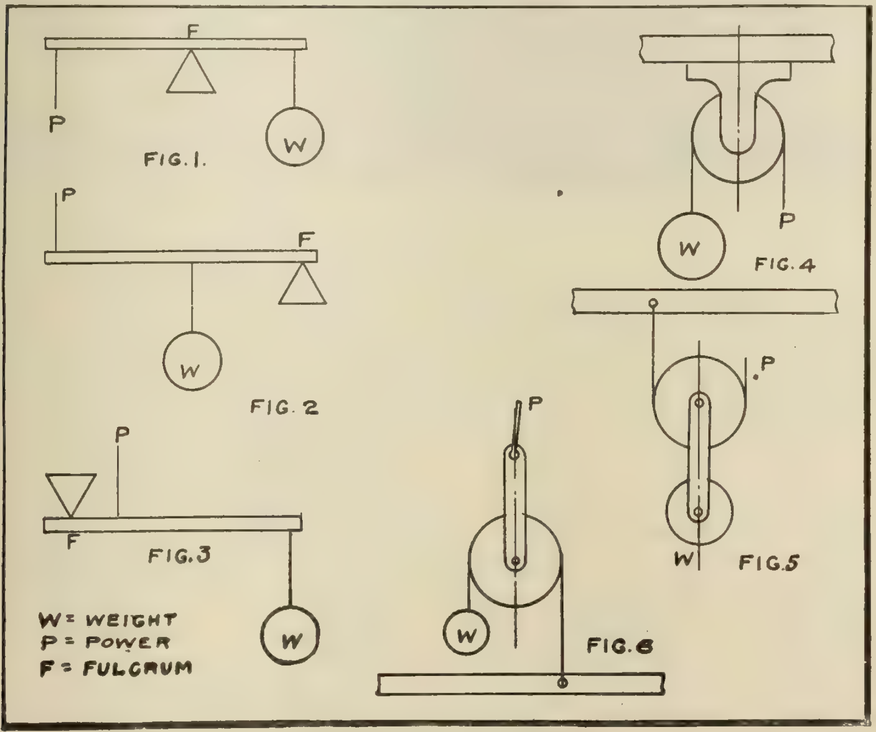
(6) Some time ago in looking over some new 5-16 in. drills I had purchased, I found one which was fluted left handed. It struck me as being something of a curiosity but I immediately saw a use for it. I laid it carefully away for removing 3/8-in. set screws. If we had much of this work to do I would buy left hand drills in all the tap sizes in use. By reversing the belt on the drill press, the left hand drill removes the burrs at the top of the thread and then unscrews the broken screw without injuring the thread in the least.

* * *

DATA ON ROPE SHEAVES.

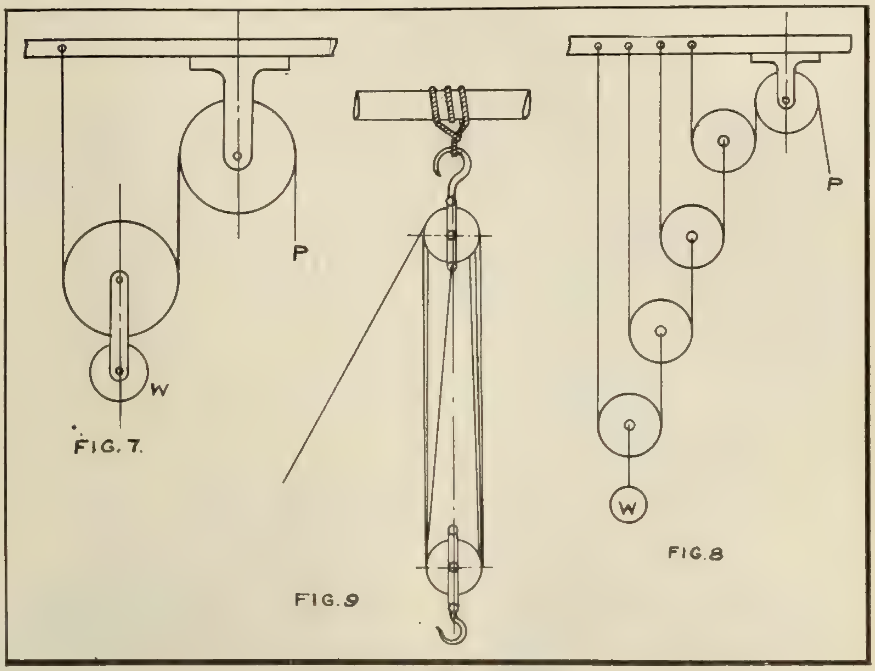
By H. Womersley.

ROPE sheaves are an important factor in mechanical engineering, and much time is wasted, owing to men in charge not knowing the fundamental principles involved in their application. I have seen men sent out to work on jobs after the most haphazard fashion. The weight to be lifted, size of blocks, and the power required being never considered. Sometimes more men are sent on a job than are necessary, causing additional expense; while at other times too few are sent. Varied are the arrangements which can be made and utilized for lifting weights with rope and tackle, and, therefore, I will state the principles relative to rope sheaves as applied to mechanical power, transmission, so that the reader can work out the different problems which crop up when following an engineering occupation.



DATA ON ROPE SHEAVES.

Mechanical powers are certain simple mechanical arrangements whereby weights may be raised or resistance overcome through the exertion of less power than is necessary without them. Levers come under the same class as rope sheaves; therefore, a few words on levers previous to dealing with the former will enable the reader to better follow the subject.



DATA ON ROPE SHEAVES.

Levers are of three classes. In a lever of the first order the fulcrum is between the power and the resistance, as shown in Fig. 1. In a lever of the second order, the resistance is between the power and the fulcrum, as shown in Fig. 2, while in a lever of the third order, the power is between the fulcrum and the resistance, as shown in Fig. 3.

The rope sheaf consists of a wheel over which a rope is passed to transmit the force applied to the cord in another direction. There are two kinds of sheaves, one turning on fixed centres, the other turning on traversing centres. The fixed sheaf, Fig. 4, acts like a lever of the first order. It affords no mechanical advantage, and merely changes the direction of the force, affording greater facilities in the application of force, as it is easier to pull downwards than upwards. In this class, the power is equal to the weight to be raised.

The movable sheaf, Fig. 5, acts like a lever of the second order. One end of the rope is suspended to a beam, as a fulcrum, and the weight is attached to the axis of the pulley. This type of sheaf doubles the power at the expense of speed, the product of the power by the diameter of the pulley being equal to the product of the weight by the radius of the pulley.

A movable sheaf acting as a lever of the third order is shown in Fig. 6. One end of the cord is fixed to the floor, and the weight is attached to the other end, the power being applied to the axis. The power is equal to twice the weight, and the product of the power by the radius of the pulley is equal to the product of the weight by diameter of pulley. In Fig. 7 the power is equal to one-half the weight.

A combination of movable sheaves with separate and parallel cords is shown in Fig. 8. Each of them reduces the resistance to the extent of one-half; dividing and sub-dividing the weight successively by two as many times as there are movable pulleys, and the weight may be found by multiplying the power successively by two as many times as there are movable pulleys. Blocks and tackle of the usual kind are shown in Fig. 9. In this system of fast and loose pulleys there is one fixed and one movable block, and a single continuous cord, which is passed over the moveable and fixed pulleys in succession.

Rules and Examples.

I will give a few rules and examples bearing on how to find the power to lift a weight. and on how to find weight that will be balanced by a given power.

To find the power: Divide the weight to be raised by the number of cords leading to, from, or attached to the lower block, and the quotient is the power required to produce equilibrium, provided friction did not exist. When the fixed end of the rope is attached to the fixed block, the power may be found by dividing the weight by twice the movable pulleys, and when the fixed end of the rope is attached to the movable block, the power may be found by dividing the weight by twice the number of movable pulleys plus one.

To find number of sheaves or cords: Divide the weight to be raised by the power to be applied, then the quotient is the number of sheaves in, or cords attached to the rising block.

Example 1.—What power is required to raise a weight 3,000 lbs. by means of a four and five-sheaved block and tackle, the four sheave being the movable block. Necessarily, there are nine cords leading to and from the rising block, consequently $\frac{3,000}{9} = 333\ 1\text{-}3$ lbs. power required.

Example 2.—Suppose I have to raise a weight of 4,256 lbs. with power of 500 lbs., what kind of block and tackle should I use? Dividing $\frac{4256}{500} = 8.51$ cords, hence there must be four sheaves or 9 cords in the rising block.

Rule 3.—To find the weight that will be balanced by a given power. When the rope is attached to fixed block, multiply the power by twice the number of movable pulleys, and when the rope is attached to the movable block, multiply the power by twice the number of movable pulleys plus one.

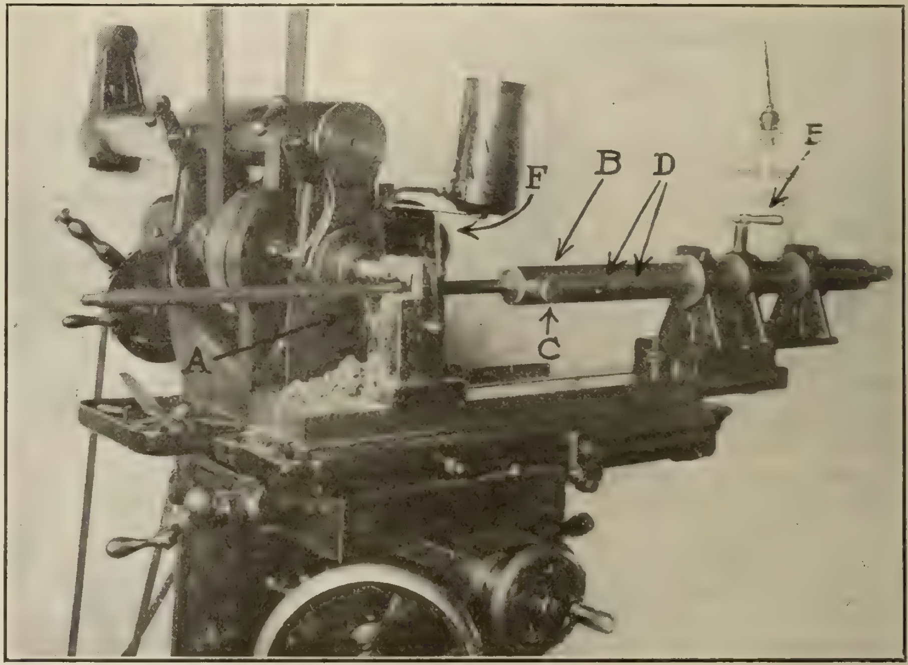
⁂

KEYSEATING AUTOMOBILE CAM-SHAFTS.

By A. E. G.

ONE of the large automobile companies, which uses the keyed-on type of cam on their valve operating shafts, uses the fixture shown in the accompanying halftone, to hold the shaft while milling the Woodruff keyways.

The shaft to be milled, is run through the arch of the rest (A), and the end is locked into the master bar (B), by means of the knurled-head screw (C). The master bar has hardened steel bushings like (D), set into it in positions corresponding to the exact positions of the keyseats to be cut. A hardened locating pin, operated by eccentric lever (E), is made to fit accurately into the bushed holes of the master bar, so that all the operator has to do, after placing his shaft, is to move the master bar so that the pin will go into the first bushed hole. The keyway is then cut by raising the miller table to a stop. The table is then lowered, and the bar moved till the pin will enter the next hole, and so on. The lever (F) operates an eccentric clamp, used to hold the cam-shaft firmly down onto the V of the rest. With this type of fixture, it is impossible for the most unskilled operator, to make a mistake in spacing properly.



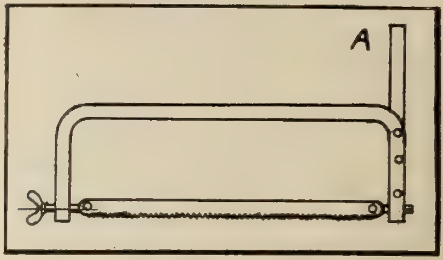
KEYSEATING AUTOMOBILE CAM SHAFTS.

⁂

HACKSAW FRAME DEVICE.

By A. L. M.

THE hacksaw frame shown here has been found very useful on odd-shaped pieces or large stock that could not be handled in the regular power saw. The frame is made heavy of wrought iron, the piece (A) being riveted to it and held in the tool post of a shaper. After removing the feed screw from the head, slack the gib enough to allow slide to drop of its own weight, and fasten clapper block so that it cannot lift on return stroke. The small square pieces inserted through frame to hold the saw take away any chance of saw twisting when being tightened. I recently took 6 cuts through 6½ inches diameter tool carbon steel and received good satisfaction.



HACK SAW FRAME DEVICE.

REPAIR OF FIRE-BRICK LININGS.

A MIXTURE consisting of equal parts of carborundum fire sand and fire clay or kaolin is extensively used for patching holes or broken parts of fire-brick linings and for filling open joints in furnace walls. It is used to good advantage in ordinary crucible furnaces for brass and steel, also in copper reverberatory furnaces for keeping the side walls in repair. By its careful use, it is possible to double the life of any fire-brick lining.

The mixture is largely used in repairing the Schwartz downdraught furnace, and also a wash applied daily after the melting. A mixture of equal parts of fire sand and fire clay is used successfully in repairing the brick linings of converters, which are subjected to extreme corrosion by the flame.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

DOUBLE ACTING SINGLE CAM PRESS.

THE double acting single cam press shown in the accompanying illustration is a new style of machine which has been designed for the purpose of handling celluloid and rubber, or other material that work better under heat up to 600 degrees Fahr. It is better suited for pliable materials than for metals. The machine is for the heating, as well as the working of the materials to be treated.

The press is simple in construction and easy to operate. The ram running between the outer gibs, or cutting ram, is actuated by two connecting rods which straddle the crankshaft and which operate at a stroke of 1 inch. The centre or drawing or forming plunger passes up and down through a bronze lining, inside of the blanking ram, and also has a special and separate adjustment. The top of this ram is made in the form of a yoke and is supported by a spring adjustment to the upper part of the frame of the press. It is actuated by a single split cam, Fig. 3, of hardened and ground tool steel. This cam is made in halves, and after hardening is accurately fitted. It is then taken apart, keyed and screwed on the centre of the crankshaft directly midway between the upper boxes of the press. While the cutting stroke of the outer blanking ram is 1 inch, the total drawing stroke afforded to the inner ram by this cam is 1¾ inches. When the press is started, both the blanking ram and drawing ram start, the path of the cutting or outer ram being one inch, all told, on direct eccentrics. The drawing ram travels downward 1¼ inches, dwells for one-quarter of the stroke, and then draws the remaining part of the stroke which is ½ inch.

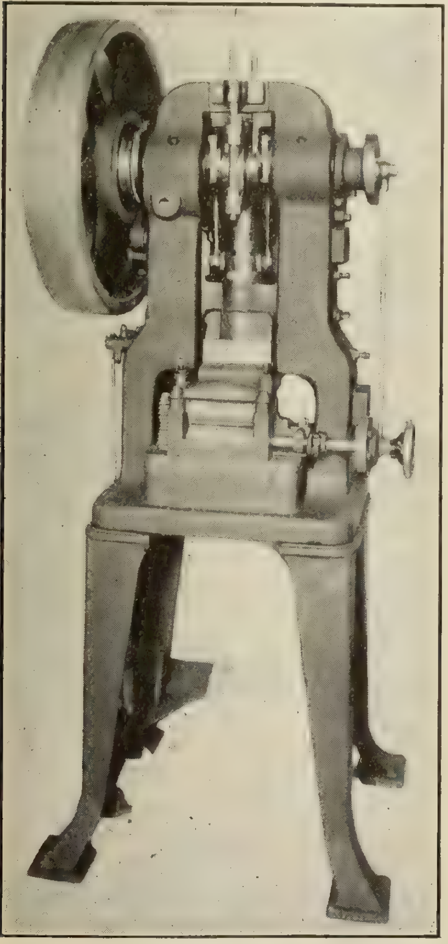


FIG. 2. SPECIAL DOUBLE ACTING SINGLE CAM PRESS.

On the bolster plate of the press is set a special die holder, Fig. 1, two holes can be seen which are for the purpose of inserting electric terminals. In the chuck or punch holder of the press is a recess for two more electric terminals. These terminals are at right angles to those in the die holder, and there is one in the rear and the other in front, electrically connected. The die holder, as well as the punch holder, is cored out on the inside so as to permit these particular parts to be heated up to a temperature of 500 degrees. The celluloid or hard rubber is fed through the roll feed in cold stage as shown in Fig. 2, going from the rear of the press. The centre of the roll feed frame is located 8 inches from the centre of the ram, and is entirely separate from die holder or punch

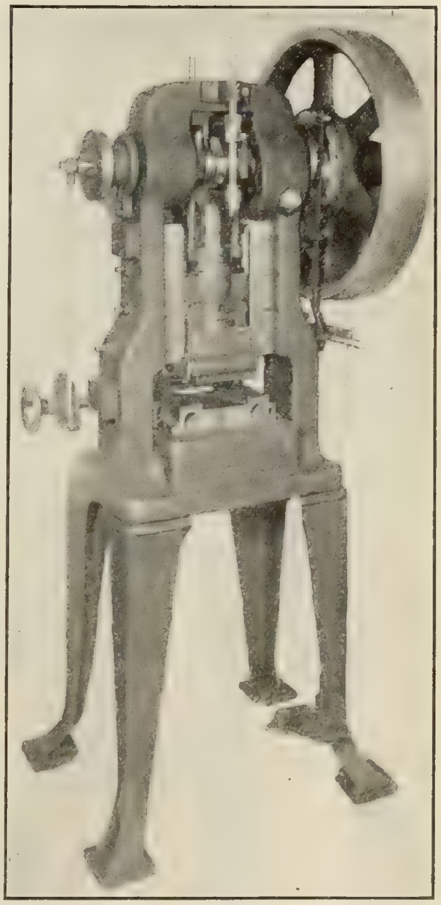

FIG. 1. SPECIAL DOUBLE ACTING SINGLE CAM PRESS.

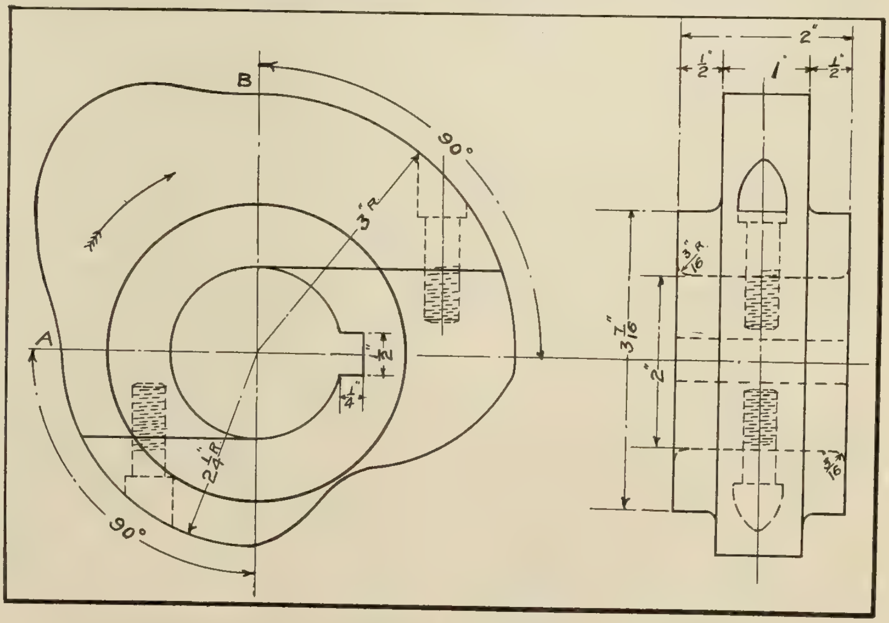

FIG. 3. SINGLE SPLIT HARDENED AND GROUND TOOL STEEL CAM.

holder, thereby allowing the temperature to be practically normal at all times, and, when the stock is passed through the feed, it is received through the dies cold. The press is started and cuts the discs from the sheet. The drawing ram then comes down and draws or forms them into the required shape. The object of allowing a dwell after 1¼ inches has been traversed is due to the fact that the material is very thick and this allows the impression to be made gradually which has the effect of making tthe design or formation much more distinct.

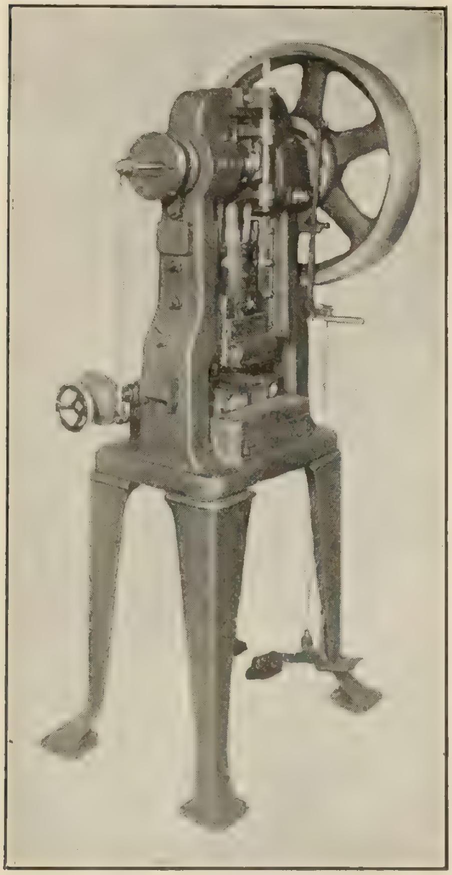

FIG. 4. SPECIAL DOUBLE ACTING SINGLE ACTING CAM PRESS.

Another design, fitted with a roll feed, is being prepared which will include a dial feed for secondary or special operations in combination with metal when desired. The press weighs 1,600 lbs., and occupies floor space of 24x30 inches, with an overall height of 6 feet.

The machine was designed, and is being put on the market by The Standard Machinery Co., Providence, R.I.

PILKINGTON'S GLASS FACTORY.

WORK on the new glass plant of Pilkington's, Ltd., at Thorold, Ont., is advancing, the foundations for nearly all the buildings having been completed. The steel framework, which is 200 x 90 feet, with a wing 100 x 90 feet in size, is well on to completion, and the excavations for the furnaces have been commenced.

In what is known as the "flattening" building, the steel girders are being erected on one side. This building will be 250 x 200 feet. A building for the production of gas and two large storage buildings are also to be constructed, and the excavation will begin soon. Railway switches are laid into the property, and a trestle to be used in unloading of coal is being built.

LACHINE CANAL RETURNS.

THE further the season advances, the greater grows the increase in the volume of traffic through the Lachine Canal. Grain passing through the canal into the harbor to October 1 is close on 14½ million bushels more than for the corresponding period of 1912. Flax seed is responsible for nearly six million bushels of the increase, and wheat for over five million bushels. The only decrease is in corn, caused by the failure of the crops in the States of the Middle West, a failure which has already resulted in two shiploads of corn being despatched from the Argentine Republic to Montreal direct. The coal trade shows a remarkable increase, the returns showing a total increased traffic of nearly 356,000 tons. All other analyses of the figures for 1912, compared with those for the present season, show increases as remarkable in their way as those quoted above.

Cereals.

Wheat brought down to the harbor measures up to 20,621,325 bushels for 1913 up to September 30 inclusive, as against 15,574,659 bushels for the corresponding period of 1912, an increase of 5,046,666 bushels. Corn shows a decrease of 55,697 bushels, the figures being 182,718 bushels for the present year and 238,415 for 1912. Oats have increased by 1,430,307 bushels, the quantity for this season to date being 7,907,473 bushels, as compared with 6,477,166 bushels for the corresponding period of 1912. Barley has increased by 2,160,614 bushels. For 1913 to date, the return is 2,623,258 bushels, as compared with only 462,744 bushels, an increase which is in one respect, more remarkable than any, in view of the slender proportions of the traffic last year.

Rye measures up to 270,249 bushels, the traffic in this cereal having been practically nil last year. Flax seed shows an increase of 5,596,566 bushels, the figures for this season being 5,971,311 bushels, as compared with only 374,745 bushels last year. The total quantity of grain brought down the canal for this season to date is 37,576,434, as compared with 23,127,729 bushels for 1912 up to September 30 of that year, an increase of 14,448,705 bushels.

Coal.

Coal brought down the canal this year, so far, weighs up to 679,763 tons, as compared with 355,846 tons, and coal landed at various points on the canal banks 340,463 tons, as compared with 308,438 tons, an increase to the harbor of 323,917 tons and to the canal banks of 32,025 tons.

Permits issued to boats to pass through the canal this season to date number 4,933, as compared with 4,525, an increase of 408 permits.

General Comparisons.

The following comparisons are for the month of September only, this year and last, and not from the commencement of the season: Number of trips made last month, 1,389, as compared with 1,346, an increase of 43. Tonnage operated last month, 711,203 tons, as compared with 576,308 tons, an increase of 134,895 tons. The number of passengers carried last month was 16,309, as against 11,682, an increase of 4,627 passengers. Cargo tonnage operated last month totalled 601,350 tons, as against 447,493 tons, an increase of 153,857 tons.

WATCHING CANADA.

WARNING against Canadian competition in water transporation was sounded by John A. Bensel, State engineer and surveyor, in an address to the Chamber of Commerce, Buffalo, N.Y., recently. Canada, he said, is spending many millions on its waterways, and "if Buffalo is to retain her position as a great transportation point," said Mr. Bensel, "her people must never lose interest in the State waterways. Future competition with Canadian waterways must not be overlooked."

* * *

Pigeon, Pigeon & Davis, Patent Solicitors, Montreal, report that 164 Canadian patents were issued for the week ending September 30th, 1913, 109 of which were granted to Americans, 28 to Canadians, 14 to residents of Great Britain, and 13 to residents of foreign countries. Of the Canadians who received patents, 8 were residents of Ontario, 8 of Manitoba, 5 of Quebec, 4 of British Columbia, 1 of Alberta, 1 of Saskatchewan, and 1 of Nova Scotia. In the United States, for the same week, 496 patents were issued, 9 of which were granted to Canadian inventors.

THE USEFULNESS OF DEPRESSIONS.

DEPRESSIONS, it would appear, in the opinion of men entitled to be regarded as authorities, have their duties. One of the latter, and perhaps the most important, is to shake water out of the scrip and inflation out of values. Casualties and crashes which added dramatic incident to the contraction of credit in 1907 left the public in the general belief that the wind had been thoroughly and ruthlessly let out of values, and credit had been enthroned on an absolutely solid basis.

Shortly after trade began to expand in 1909, and securities at the same time were steadily finding a market at better figures, it was authoritatively stated that the financial and commercial situation in Canada had not been as thoroughly purged of over-capitalization and inflation of credit as it ought to have been.

Times such as those of the past few months have disclosed to the public some weakness in the financial situation of Canada, especially in the overhead organization and capitalization of several important Canadian industrials. They were evident to close observers in the beginning of the year. By those familiar with their development it was regarded as quite certain that "fair weather" only could postpone re-organization. Re-organization of industries in which very large capitalization is involved is a very disturbing factor in commercial life.

A few years ago, it will be remembered, the tendency towards mergerizing every industry created the impression that the people were to be robbed and the captains of industry gorged with stolen wealth. Captains of industry worthily entitled to that appellation usually derive wealth as a result of a good part of a life-time's work in the exercise of ingenuity, method and hard work. In recent years, however, captains of capitalization have arisen who by a merging process extract from industries enjoying a moderate degree of prosperity sudden wealth and then leave the industries merged to depend on tariff favors and long and laborious struggles to make good the promises of the prospectuses.

Can it, however, be said that as business enterprises—the mergers and the combines—in Canada have made an extraordinary good record for themselves in the matter of earnings upon the capital invested? During the few months of the financial stringency of the current year there have been, to say the least, a few delinquents in the matter of dividends and delinquents also in the matter of interest on bonds.

It cannot be gainsaid that the captains of capitalization have been more successful than the captains of industry—those directly responsible for the operation of the actual plants. Fortunes have been made by those who handled the scrip, but it is those who turn the wheels and get the orders upon whose shoulders rests the responsibility for earning the dividends promised by the prospectuses. The latter have a very hard task "cut out for them."

Merger embarrassments, those under public scrutiny and those seeking to avoid the public gaze by private negotiation, need not cause the business community as a whole much worry. That investors should suffer is regrettable, yet the public stands to gain by the good work which depressions can effect. Such periods disclose the identity of corporations not on a sound basis. There is no lack of opportunity to profitably place at the disposal of Canadian consumers necessities for the manufacture of which Canada provides practically all the essential raw materials. Those which for success depend not unduly upon tariff protection, but upon skill in management, enterprise, and technical knowledge, and respect for the pockets of the consumer as well as the investor will win out and aid depressions in freeing Canadian industry of the promoter-financiers who leave on the credit of the country stains which are difficult to obliterate.

It is quite possible to over-rate the damage they can do. Canada is too vigorously active to be seriously encumbered by financial blundering. Production of real wealth is going ahead by leaps and bounds and will continue to do so. The field, mine, the lakes and oceans of the Dominion are yielding treasures in more generous quantities every year. So long as nature thus responds to the efforts of Canadians they can look forward to business conditions of a satisfactory character, not materially different from those of the period preceding present dullness.—MacLean's Magazine.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, October 21, 1913.—In the machinery market no big business has been placed during the past week; but prospects have a generally brighter look than they have had for the past month or two. In fact the business in small pick-up orders has been quite good of late. Taken all round, conditions are good and there is no cause for pessimism. There is, perhaps, too much tendency to compare this year with 1912, which, of course, was an exceptionally good year. Most, if not all, of the machinery brokers, have done an increased volume of business, the increase in some cases being quite large. The Rudel-Belnap Machinery Co. have found their business expanding so rapidly that they are now about to open a branch office in Toronto. This will be in charge of Mr. A. E. Juhler, who has resigned his post as Toronto manager of the General Supply Company in order to accept the position. Williams & Wilson have also had a very good year to date, their turnover having already exceeded last year's figures. This firm represents, among many other machine tool builders, the American Tool Works Co., whose Mr. J. B. Doan was in town recently to consult with them.

Pig Iron, Metals, Eetc.

The demand for foundry pig continues to be highly satisfactory. A. C. Leslie & Co. have again booked several good orders for English pig and fully expect that this state of affairs will continue right up to the close of navigation. Prices are quoted locally at last week's figures. Copper is unchanged. The present demand for this metal is very quiet. Lead shows a firmer tendency, but supplies for present delivery are practically non-existent.

General Notes.

On Friday, October 17, a meeting of the bondholders of the Canada Iron Corporation was held, when a resolution was passed authorizing the liquidators to borrow money up to $250,000 in order to carry on the foundry portion of the business, which comprises plants at Fort William, St. Thomas and Hamilton in Ontario; at Three Rivers in Quebec, and at Londonderry in Nova Scotia. The completion of the arrangements to carry on these foundries is important as it will mean the employment of a large number of workmen, and will in this way be of direct benefit to the municipalities where the plants are situated. It is further, a matter of general interest to all classes of the corporation's creditors. The foundry business of the corporation amounted to about $4,000,000 last year and while it has been affected by liquidation proceedings, and may not be as great this year, it is yet sufficiently large to form the basis for the reorganization of the corporation which is now being worked upon by the English bondholders who were here recently. It is further announced that it is not proposed to operate the furnace and mine departments of the corporation during the period of liquidation. Some of the plants are already closed, and the rest will probably be closed shortly.

An Ottawa press despatch states that Messrs. Thomas Cantley, of the Nova Scotia Steel and Coal Co., and Mr. W. B. Ross, of Halifax, who is closely associated not only with the Dominion Iron and Steel Co., but also with high Government officials, being a Senator, were in conference last week with members of the Government, and that strong pressure was brought to bear in order that further assistance of some character might be given to the iron and steel industry.

Toronto, Ont., October 21, 1913.—The following is a statement of the condition of the steel market in Pittsburgh at the present moment: Bars are especially strong considering the condition of trade; plates have a downward tendency, and have dropped five cents this week; structural steel is holding firm because the mills are filled up with orders for delivery within two and three months, and with these conditions there will be no drop in price. The steel business around Toronto is standing up well, much better than in July. Prospects are not very rosy for the winter. There may be a big demand in November for quick deliveries of structural steel to finish jobs. An engineer who does considerable building of warehouses and smaller structures stated this week that ninety per cent of his work was held up for want of money. The plans for his work are all ready, but he has no idea when the required cash will be forthcoming. Manufacturers are buying about as usual, especially in the east. Their orders are as plentiful as in the spring. The falling off in business will be due to a slackening off in the building trade. Inquiries for structural steel for next spring are away below average. Drummond, McCall & Co. report business rather quiet in all lines. Their mill business is slight, but their warehouse is busy, particularly in lines required for repair work. Makers of screws, nuts, bolts, etc., report no change in prices, nor do they expect any. They find trade a little better in these lines.

Machine Tools.

Inquiries for machine tools are few. The Toronto Structural Steel Co. placed their order for machine tool equipment with the A. R. Williams Co. this week. It called for an outfit costing about $3,000. The same dealers secured an order from the Algoma Eastern Terminals, Sudbury, Ont., through the Arnold Company, consulting engineers, of Chicago, for a drill press. Several other tools were required. The F. B. Sturtevant Co., of Galt, have bought a supply of machine tools from their Boston plant. W. F. and John Barnes, Rockford, Ill., have sold, through their Canadian agents, 15 Barnes drilling machines to the Massey-Harris Co. for their plants in Toronto and Brantford. The Canadian Fairbanks, Morse Co., the A. R. Williams Co., and Mussens, Ltd., each secured part of an order for machine shop equipment from the city of Fort William for their car barns. The Pollard Mfg. Co., Niagara Falls, N.Y., have bought a 12½-ton Niles crane for their new foundry from the Canadian Fairbanks-Morse Co. There is a big demand just now for individual electric lighting equipment. These usually consist of an oil engine, dynamo, storage battery and switchboard.

Metals.

Business in metals is stagnant. The market just now being very depressed. So far, dealers report no change as a result of tthe American tariff.

St. John, N.B., October 20, 1913.—At a meeting held last week, the Council of the Board of Trade decided to memorialize the Government with regard to the extensive development at Courtenay Bay in the hope that the work will be rushed to completion ahead of the time stipulated. J. Norton Griffiths, M.P., of London, England, who was in the city during the week made the statement that his firm who have been at work on the $12,500,000 contract at this site, could easily finish the work within two years before the time stipulated provided the department would vote sufficient money for the purpose. The contractors are anxious to complete the work. The necessity for the more rapid completion of the work will be brought out in the petition to be presented to the Government by the Board of Trade.

There has been much indignation in St. John over the announcement that the C.P.R. Empress steamers would not sail from the port this winter, but from Halifax, and a large committee from the Board of Trade went to Ottawa to press the claims of the city upon the Government. Amongst those in the delegation besides the mayor, were Hon. John E. Wilson, R. B. Emerson, Hon. W. H. Thorne, J. A. Likely, and other manufacturers.

F. H. Anson, of Montreal, vice-president of the Atlantic Sugar Refineries, Ltd., was in the city last week inspecting the work on the local plant. He said that he was very well satisfied with the progress made, considering the many difficulties encountered. The work on the new plant is well in hand and a large crew of men are employed in its construction.

Plans have not been definitely completed for the erection of the new buildings and plant for T. McAvity & Sons in the Marsh road, as there is some litigation over a question of a part of the land which they wish to acquire. One of the heads of the firm said that it might be a month and it might be much longer before they would have any definite announcement to make regarding the projected plant. This, it is understood is to be very extensive and it is said that the work will involve an outlay of at least $1,000,000.

Senator Domville said last week that negotiations between himself and an English syndicate had been completed whereby the extensive oil shale properties in Albert county, N.B., will be developed within a short time. Scientific tests have proved the value of the property. It is expected that an industry of no small magnitude will spring up, and the progress of the enterprise will be followed with interest.

The last of the lumber mills in St. John to renew operations since the strike of three months ago, started work this morning, being that of F. E. Sayre & Co. It has lain idle since the beginning of the strike. All the other lumbering plants are now going full blast.

A. W. Meakins, of the J. S. Metcalfe Construction Co., was in St. John during the week in connection with the building of the new grain conveyors at west side. The plans for the conveyors have been drawn up, but not yet received.

NO BOILER EXPLOSIONS.

JOHN W. PECK, chief inspector of machinery for the British Columbia Government, whose department includes the inspection of boilers, in his annual report for 1912, says that there were no boiler explosions in British Columbia in that year. There were three fatal machinery accidents only, and these were not due to any defect in the machinery. All three occurred in District B, which is Vancouver Island, the province being divided into four inspection districts, with headquarters in Vancouver.

It is significant of the industrial growth of the province that the number of new boilers inspected last year was 621, as compared with 287 in 1911. The inspector also notes that out of 968 plates for new boilers inspected in 1912, only eight were condemned, which is the best showing made by boiler plates in this province since the department was organized. The total number of new boilers on the books was 4,561.

As might be expected, the demand for steam engineers of all four classes brought forward a number of candidates for certificates in 1912. In all 1,113 men were examined, of whom 768 passed successfully. The majority of the candidates sat for fourth class certificates, there being 563 of these, of whom 346 passed. Only nine tried for first-class certificates, and 109 logging-donkey engine certificates were issued and 15 special locomotive.

ACCURATE SIMPLICITY.

By A. M. L.

A JIG or fixture is valuable only in proportion to its efficiency. Many of us have, in passing through factories, seen, and in a great many cases, had our attention proudly called to some elaborate fixture, designed for duplicate production. How often has our friend, the superintendent or foreman, explained same in about the following manner:—

"Here is a clever little attachment; the only trouble it ever gives us is keeping it clean, but the operator overcomes that by blowing it out with compressed air after each piece is machined. You see, when the piece is finished, we back up this screw, which releases the pin which allows this slide to slip out. Then, after removing that bushing, the work is turned a quarter of the way around, and you lift this little lever which allows the piece to be lifted out.

"Our output? Oh, about 500 per day of ten hours."

We pass on to where a boy is busy putting small parts in a little unpretentious jig under a drill press. His chief trouble seems to be to keep from whistling, which, if indulged in, would worry his neighbor across the aisle to a sufficient extent to cause him to forget the formula for placing pieces in his jig. We look over his shoulder. "Oh, there is nothing interesting in that jig," our friend informs us. "Just a block, a couple of pins as gauge points, and a wedge.

"Dirt? Oh no; it never gives us any trouble in that respect. There isn't any place for the cuttings to lodge.

"He drills about 3,000 pieces a day."

Again, we pass along to the next, and so on. Some are simple, some are complicated. Some are so simple that they seem ashamed of their simplicity; working along day by day, completely overshadowed by their grand and imposing, although not nearly so efficient brothers.

Let us not be misunderstood, however. It is not always practical to make a simple jig that will perform some delicate or intricate work; nor can all pieces be machined at the same rate per hour. We can, however, strive to increase our output by decreasing the complications attending many of our operations. This is an old story, a song of years ago, this song of simplicity, but may we humbly advance the statement that it is much more to the point to-day than ever before. Now, in the rush and whirl of things, now, in this day of top notch efficiency, let us post our motto at every corner of our shops: "Accurate Simplicity."

In this world, a man must either be a hammer or an anvil.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Walkerton, Ont.—A foundry will be erected here by Isadore Ellinghausen.

Montreal, Que.—The Argus Fire Alarm Co. are building a new factory to cost $100,000.

Medicine Hat, Alta.—The Alberta Rolling Mills, Ltd., are planning an extension to the plant.

Windsor, Ont.—The Swedish Crucible Co. are erecting a plant here, and will manufacture automobile forgings.

Brantford, Ont.—A factory core room will be built by the Massey-Harris Co., Ltd., at a cost of $8,000. A. J. Cromar is general contractor.

Woodstock, Ont.—The Wayne Oil Tank & Pump Co., of Fort Wayne, Ind., will build a branch factory here. They ask for the loan of $12,000.

Gananoque, Ont.—A start has been made in rebuilding the spring factory of the Ontario Steel Products Co., which was destroyed by fire about ten days ago.

Montreal, Que.—A winding-up order has been granted by the Superior Court for the Canadian Drednot Motor Trucks, Ltd. A meeting of creditors was held on October 17th.

Vancouver, B.C.—Chief Engineer Conway, of the B. C. Electric Railway, announces that the company will build car repairing shops between Prior Street and Venable Street.

Vancouver, B.C.—Yarrow's, the British marine engineers, are contemplating erecting works at Esquimault, B.C., or at Vancouver, and perhaps in the Maritime Provinces. Mr. Yarrow is on his way to Canada.

Bridgeburg, Ont.—The Mesta Machine Co., of Pittsburg, Pa., have leased part of the Mentholatum Building, where they will manufacture plate valves. Operations should begin in January.

Goderich, Ont.—The American Road Machinery Co. have secured an option on several town lots five acres in area, and will shortly erect an addition to their factory. The proposed building will be 70 by 100 feet.

Montreal, Que.—Contracts have just been placed by the Eugene Phillips Electrical Works of Montreal for a large amount of new machinery with which to equip the $250,000 extension to their Montreal plant.

Collingwood, Ont.—The Imperial Steel & Wire Co. commenced operating the nail and wire mill this week. During the summer the nail department of the wire mill was closed down and a number of their employees let go.

Hamilton, Ont.—The Tallman Brass & Metal Co., Hamilton, Ont., have purchased the plant and machinery of Lomas & Nelson, art metal and electric fixture manufacturers, and will make electric fixtures from original designs.

Prince Albert, Sask.—The Royal Farm and Machinery Co., of Manitoba, have secured a free site of ten acres from the city, and will at once proceed with the erection of a factory and plant for the manufacture of all kinds of farm machinery, from a small cutter bar to a binder.

Electrical

Weston, Ont.—The Water, Power and Light Commission will instal high voltage tanks in the streets.

Fredericton, N.B.—Tenders will be called for an electric lighting and power system for the city opera house.

Yorkton, Sask.—The town is building a power house at a cost of $36,000. Ritchie & Walters, general contractors.

Bury, Que.—The Westbury Electric Light and Power Co. intend installing electric light in Bury in the near future.

Thorold, Ont.—A Hydro-Electric engineer has been appointed to estimate the cost of the system for Thorold township.

Welland, Ont.—The Canada Forge Co. have begun work on a new transformer house, which will double the capacity of their present one.

Hamilton, Ont.—Engineer Webb of the Ontario Hydro-Electric, is preparing plans for providing the township of Barton with hydro power.

Montreal, Que.—A winding-up order has been granted against the Universal Electric Economy Co., Ltd., on the application of Walter Rawlings.

Medicine Hat, Alta.—Plans are being prepared for an addition to the municipal power plant and the installation of machinery, estimated to cost $250,000.

Edmonton, Alta.—It is estimated by the Hon. Mr. Sifton, premier of Alberta, that there will be a surplus of $100,000 on the Government telephone operation for this year.

Cornwall, Ont. — The St. Lawrence Power Co., of Massena, has been granted permission to dredge the Grasse River. from the power house to its mouth, a distance of nine miles.

Gananoque, Ont.—John M. Campbell is building a dam at Kingston Mills to increase the fall from 10 to 40 feet. He will instal turbines, and generate electricity for local farms.

Edmonton, Alta.—Plans have been prepared and a tender obtained for a steam engine for the street railway power department. The price is $11,460. A surface condensing plant is also required.

General Industrial

Montreal, Que.—The Canada Cement Co. will equip a new $1,000,000 cement plant.

Windsor, Ont.—The Burlington Windsor Blanket Co., of Windsor, Ont., will locate in Toronto.

Regina, Sask.—W. H. Priest will build a woollen mill, 60 x 55 feet, employing 40 hands.

Edmonton, Alta.—The North-West Biscuit Co., recently organized here, are building a factory.

Victoria, B.C.—The British Columbia Pottery Co. plan to rebuild their plant recently damaged by fire at a cost of $125,000.

Pitt Lake, B.C.—The British Columbia Transport Co. will expend $100.000 for a rock crushing plant and other improvements.

Tillsonburg, Ont.—Snedicor & Hathaway's shoe factory, recently erected here, was damaged by fire to the extent of $1,000 last week.

Lindsay, Ont.—The local mill of the Canadian Cereal and Milling Co., has been closed. Others belonging to the same company will also be closed.

Medicine Hat, Alta.—The Hunt Engineering Co., Medicine Hat, have secured the contract to build a factory for the Canada Cement Co. two storeys high.

Brantford, Ont.—Damage amounting to $80,000 was done by fire on Oct. 19 to the factory of Thornton's, Ltd., hide, wool, and leather merchants. Mr. Thornton will rebuild.

Saskatoon, Sask.—M. L. Hovis, of Gibsonburg, Ohio, and W. R. Martin, of Medicine Hat, Alta., are prepared to place before the city council a proposal to drill a gas well within the city limits.

Edmonton, Alta.—The Alberta Legislature will be asked to vote $1,000,000 for erection of farmers' elevators in the province, $1,000,000 for telephone extensions, and $1,600,000 for public works.

Chelsea, Que.—The Canada Explosives Co., said to be a branch of the Nobel Co. of Europe, have started to build a plant here, but have been stopped by the Provincial Government owing to the proximity of Ottawa.

Berlin, Ont.—Owing to the increased demand for gas, the Light Commission will take steps to erect a new gas holder. The civic improvement expert has recommended that the entire plant be moved to the outskirts.

Caledonia, Ont.—Fire on October 11 destroyed a store house near the Grand Trunk tracks occupied by the Alabastine Co. and the Shirr Milling Co. Fifty thousand barrels of cement and machinery were practically a total loss, partially insured.

Wood-Working

Tilbury, Ont.—The Canadian Auto Top Co. contemplate the erection of a $20,000 plant.

Toronto, Ont.—Fire did $10,000 damage to the planing mill of Scoley Bros., 113 Ontario St., on October 15.

Ingersoll, Ont.—Evans Bros., makers of pianos, are preparing plans for doubling their factory, and will instal new equipment.

Yarrow, B.C.—J. H. Maddaugh is erecting a small shingle mill at Yarrow, Vedder Lake, B.C. The plant will use steam power.

Ottawa, Ont.—The planing mills of the Greater Ottawa Lumber Co. here were destroyed by fire Oct. 13, with a loss of about $60,000.

Verdun, Que.—Damage to the extent of $7,000 was done to the sash and door factory of C. E. Deschanaux on October 14. Insurance, $4,000.

Fort Qu'Appelle, Sask.—Geo. K. Grass of Sintaluta, is establishing a plant here for the manufacture of boats, accessories, and some lines of furniture.

Victoria, B.C.—The Cameron Lumber Co. has taken out a permit to erect a compressing plant on the Carbally Estate, Victoria. Estimated cost, $10,000.

L'Epiphanie, Que. — The Ferland Bros'. sash and door factory at L'Epiphanie, Que., was destroyed by fire. The loss is $25,000. The owners will rebuild.

Wardner, B.C.—The Crow's Nest Pass Lumber Co. is erecting a planing mill, replacing the one which was burned this summer. D. C. Patmore, Spokane, is architect.

Winnipeg, Man.—E. H. Briggs & Co., Ltd., manufacturers of brooms, etc., will increase their capital stock from $40,000 to $200,000, and add to the capacity of the plant.

Montreal, Que.—The sawmill belonging to the MacLaren Company, Bout De L'Isle, Que., was recently destroyed by fire at a loss of $50,000. The company will rebuild.

Stratford, Ont.—George Whitesides, Toronto, is starting a paper box factory here, and will spend from $20,000 to $25,000. A building has been secured and much machinery purchased.

Vancouver, B.C.—Foley, Welsh & Stewart, railroad contractors, will erect a sawmill 14 miles north of Newport, B.C. They contemplate building another mill in the Lillooet district, B.C.

Dane Creek, B.C.—The Upper Fraser Lumber Co., is erecting a lumber mill at Dane Creek, B.C., on the Fraser River. It will have a capacity of 100,000 ft. per day. A. H. Edwards is manager.

Bull River, B.C.—The Canadian Pacific Railway Co. is preparing to establish an extensive creosoting plant in connection with its lumber mill at Bull River, B.C. The water power at this point will also be developed.

New Incorporations

The United States Steel Products Co., incorporated at Toronto; capital $40,000, to trade in steel products and all other kinds of goods.

The Lake View Telephone Co., Ltd., incorporated in Nova Scotia to instal a telephone system from West Bay to Roberta. Peter Dunphy, president.

Niagara Brick & Tile Co., Ltd., incorporated at Toronto; capital $100,000, to manufacture brick, tile, stone, etc., at Niagara Falls, Ont. Incorporators: Francis W. Griffiths, Hartley F. Upper, etc., Niagara Falls.

The Electric Mfg. Co., of Canada, Ltd., incorporated at Ottawa; capital $2,000,000, to carry on the business of electrical and mechanical engineers, at Montreal. Incorporators: Howard S. Ross, Eugene R. Angers, etc., Montreal.

The Parsons Motor Car Co., of Canada, Ltd., incorporated at Toronto; capital, $500,000, to manufacture automobiles and motor vehicles, at Windsor, Ont. Incorporators: Alexander J. Denomy, Thomas G. Ellis, etc., Windsor.

The Richardson Scale Co., of Canada, Ltd., incorporated at Toronto; capital $50,000, to manufacture scales and machinery of all descriptions, at Bridgeburg, Ont. Incorporators: John A. Macintosh, Wilfred C. Marsh, etc., Toronto.

Merchants Mutual Lake Line, Ltd., incorporated at Ottawa; capital $1,500,000, to construct and operate ships, and generally to carry on the business of a shipbuilding, engineering, elevator business, at Toronto. Incorporators: James S. Lovell, Charles D. Magee, etc., Toronto.

Tenders

Vancouver, B.C.—Tenders will probably be called for the erection of viaducts over the C.N.R. tracks. The sale of city debentures will enable this work to proceed.

Toronto, Ont.—Tenders will be received by the Board of Control up to November 25th, for the supply and erection of structural steel work for the Gerrard Street Bridge, over the Don River.

Toronto, Ont.—Tenders will be received up to November 25th by the Board of Control, for the installation of one or more 7½ and 20 Million Imperial Gallon Pumping Engines, three Water Tube Boilers with Piping, and Coal Handling Apparatus at the High Level Pumping Station.

Toronto, Ont.—Tenders will be received up to November 18, for the supplying and laying of an 84-inch steel conduit from the Pure Water Reservoir on Toronto Island to the South Tunnel Shaft. Specifications and tender forms may be obtained upon application at the Department of Works, Room 10, City Hall, Toronto.

Ottawa, Ont.—Tenders will be received at the office of The Commissioners of the Transcontinental Railway until November 4, for the furnishing and installing of the Electric Wiring Systems required in connection with the equipment of the National Transcontinental Railway Car Shops at Transcona, Man., about six miles East of Winnipeg.

Plans may be seen and forms of tender and specifications obtained at the office of Mr. W. J. Press, Mechanical Engineer, Ottawa, Ont., and at the office of Mr. H. H. Pinch, Assistant Engineer, Transcona, Manitoba.

Water Works

Sydney, N.S.—The city is building an addition to its pumping station.

Sudbury, Ont.—The town will spend $5,000 on extension to water mains.

Chapleau, Ont.—The township will spend $5,000 for an extension to the water mains.

Toronto, Ont.—The city will erect a large sewage disposal works on the Don banks, costing about $2,000,000.

Tilbury, Ont.—The Michigan Central Railroad will build a large pumping station to supply the town with water.

Melfort, Sask.—The town has been authorized to spend $34,000 on waterworks and $16,000 for sewerage system.

Regina, Sask.—The addition of another filter bed to the sewage disposal works is contemplated by the city council. F. McArthur, city engineer.

Toronto, Ont.—Works Commissioner Harris, is preparing plans for a great sewer system for North Toronto, and districts East and West, to cost approximately $6,000,000.

Municipal

Kamloops, B.C.—The city is contemplating the erection of a gas plant at a cost of $75,000.

Verdun, Que.—The city council have raised $200,000, which will be spent on sewer extensions and paving.

Dundas, Ont.—The Mayor has been empowered to sign a contract for from 275 to 300 street lights of 100 watts, at $9.00 each.

Kingston, Ont.—On Nov. 3 the ratepayers will vote on a scheme to grant aid by bonus of $10,000 to Frank Vandersept Samwell, tube manufacturer.

St. Marys, Ont.—The by-law providing for a loan to the St. Marys Milling Co. for an addition to their plant, which was defeated, will be submitted again.

Guelph, Ont.—The Light and Heat Commission will purchase a complete gas heating outfit, and try it out in the gas and electric light building. If satisfactory they will be sold for use in private houses.

Vancouver, B.C.—Owing to the action of the British Columbia Railway Co. in increasing its fares, the Mayor has asked the company if it will be willing to dispose of the system to the city previous to 1919, when its franchise expires.

Maisonneuve, Que.—The city has applied to the Legislature for permission to build a police and fire station, and to equip with necessary fire apparatus. Agreements will be made with the interested companies for the burying of wires in certain streets.

Railways—Bridges

Ottawa, Ont.—The Ottawa Electric Railway Co. has prepared plans for a boiler and engine house to cost $12,000.

Hamilton, Ont.—The Board of Control will call for an estimate on an inclined railway at Sherman Ave., to be operated by the city.

Drummondville, Que.—Surveys are being made of the new St. Francis Valley Railway. Grading will commence this fall. C. B. Hibbard, vice-president.

Toronto, Ont.—On a bridge which the C.P.R. is planning in the Don Valley, the city has made provision for a driveway underneath, which will fit in with the proposed boulevard along the banks of the Don.

Guelph, Ont.—The Railway and Manufacturers' Committee of the City Council are considering making an application to the Government for power to build an electric railway along the right-of-way of the proposed Hydro-Electric transmission line to Elora and Fergus, and possibly to Arthur.

Sudbury, Ont.—The Sudbury, Kipawa and Bell River Railway Co. has given notice of application to Parliament for authority to construct a railway from Sudbury easterly to the south-end of Lake Timiskaming, and thence northeasterly to the National Transcontinental Railway at Bell River.

Contracts Awarded

Waterloo, Que.—The contract has been let by the council to Mackinnon & Holmes Co., Sherbrooke, Que., for a steel bridge in the Township of Shefford.

Toronto, Ont.—The Linde-Canadian Co., Front Street, Toronto, have been awarded the contract for refrigerating machinery for the new civic abattoir by the architects, Wm. R. Perrin & Co., Chicago. This consists of a 90-ton double acting ammonia compressor driven by a 140 h.p. motor, a liquid ammonia receiver, and a Linde double-pipe ammonia condenser, expansion pipe for various rooms, etc.

Marine

Quebec, Que.—Messrs. M. P. and J. T. Davis, contractors for the new drydock at Levis, have signed the contract, and are now waiting for the Government engineer to lay out the work.

Vancouver, B.C.—The president of the White Pass and Yukon Railway announces a direct steamship service from Vancouver to Skagway, utilizing steamers costing $1,000,000.

Winnipeg, Man.—Winnipeg and St. Boniface harbor commissioners decided at a meeting held October 8 to ask the Dominion Government for $100,000 to build docks along the Red River. T. R. Veligny, Government engineer, will make a report on the actual cost of the work.

Trade Gossip

Homer & Wilson, machinists, toolmakers and metal stampers, have moved into their recently completed shop, 11-13 Lancaster Street, Hamilton, Ont.

The Hare Engineering Co. have moved from 14 King E. to 78 Duchess Street, Toronto, where in addition to convenient and commodious office quarters they will also have considerable warehouse and factory space.

John W. Peck, chief inspector of machinery for British Columbia, reports that there were no boiler explosions there in 1912. There were three fatal machine accidents, and these were not due to defects.

The Northern Motor Car Co., of Kingston, has gone into voluntary liquidation, as it finds it impossible to establish a business on a paying basis within a reasonable period. The nominal capital of

You Wish To Become a Well Read Man, Do You Not?

Each of us can probably recall to mind among his acquaintences one or more men who appear to be so well acquainted with any subject that may be brought up for conversation that they are able to enter upon a discussion or give information upon the matter whatever it may be. They are men to whom we instinctively turn for information whenever any question crops up with which we are unacquainted and upon which we need enlightenment.

At first sight there appears no particular reason why these men should be better acquainted with any particular subject than we ourselves are. They may have had no advantage over us in the matter of education. They have probably not travelled any more than we have, and as far as we can see there is no reason why we should look to them for information on diverse subjects rather than to any other of our acquaintances.

What then is the reason for this deference we consistently show them by asking their opinions on this or that question?

Consider any case, as referred to above, which may occur to you and you will find it is because your friend or acquaintance is invariably what we would call a "well read" man. No matter whether the subject under discussion be the past or present history, political or social of our own or any other country, whether it be of noted writers, painters, politicians, celebrities of any kind or of any country, the latest discoveries or inventions, the best opinion expressed by the foremost writers of the day or present questions of most vital interest, he is able to take an intelligent interest in the conversation and to contribute his own quota to the discussion, probably expressing some view point new to his auditors.

You will doubtless admit that such a man occupies to some extent an enviable position among his fellows; and the object of this article is to show you how by the employment of a small portion of your leisure time regularly, methodically, and at practically no expense to yourself, you can also occupy this enviable position and become one of those well read men, to whom your friends will turn for information whenever they may be in need of it.

You have, of course, heard of MacLean's Magazine and have probably at some time or other seen a copy. It is a purely Canadian Magazine, and was originally called the Busy Man's Magazine, a title which explains the idea upon which it was originally founded.

The business man of the present day is too much occupied in his business avocation to devote a great deal of his time to literary pursuits. In many cases the daily papers form the extent and limit of his literary experience. Now, while the reading of the daily paper is practically a duty which no live merchant should neglect, the man who is ambitious of improving his mind will feel a desire for a little more than the daily or weekly magazine can give, and this is where MacLean's Magazine stands ready to give him a helping hand.

The November number is particularly interesting and a source of interesting information. It is brimful of good instructive reading, containing just that information which is most beneficial to busy Canadian business men to keep them in touch with things Canadian.

Secure a copy from your nearest stationery dealer to-day, and become acquainted with Canada's foremost magazine.

Price 20 cents a copy. Subscription $2.00 a year.

THE MACLEAN PUBLISHING CO., LIMITED.
143 University Ave., - - Toronto.

the company is $1,000,000, of which $85,000 has been subscribed, but only $46,400 has been paid up. The liabilities are stated to be $10,000.

Albert Skinner is in Canada representing the following Sheffield firms:—Richard W. Carr & Co., steel, file and tool manufacturers; Fox Bros., Delhi Works; Bennett Farren & Co., Ltd., Devonshire Engineering Works, makers of power hammers, lathes, shovel rolls, etc. His headquarters in Montreal are at 419 St. Urbain Street.

Rae Bros., Merrick St., Hamilton, Ont., manufacturers of grinders, clutches, air compressors, and special machinery, have built a machine for making and printing brown paper bags, to the order of the Standard Chemical, Iron & Lumber Co., of Montreal. They have also recently built a spool winder for the B. Greening Wire Co., Hamilton.

The Rudel-Belnap Machinery Co., Canadian Express Building, Montreal, will in the near future open an office in Toronto. The Toronto branch will be in charge of A. E. Juhler, who is well known in machinery circles on account of his long connection with the London Machine Tool Co., and more recently as Toronto manager for the General Supply Co. of Canada. The lines handled in Toronto will be principally standard machine shop equipment, pumping machinery, etc.

The Smart-Turner Machine Co., Ltd., Hamilton, Ont., have recently secured the following orders: The Canada Ice Machine Co., Fort Qu'Appelle, Sask., one Duplex Power Pump; Geo. Gordon & Co., Cache Bay, Ont., Duplex Pump; The Institute for the Blind, Brantford, Ont., one Vacuum Pump; The Otis-Fensom Elevator Co., Toronto, one Underwriter Fire Pump; Mr. F. L. Snively, Dunnville, Ont., one Duplex Pump; The Harbor Commissioners of Montreal, Que., one Simplex Power Pump; The Dominion Canners, Ltd., Burlington, Ont., one Duplex Pump; The London Cold Storage & Warehouse Co., London, Ont., one Duplex Power Pump.

UNDER THE WINDING-UP ACT.
IN RE THE STAR IRON COMPANY LIMITED,
In liquidation.
Foundry of 30 tons daily capacity.
For sale at auction.

The undersigned will sell at their rooms, 69 St. James Street, Montreal, on Thursday, November 13th, 1913, the assets of the above estate as follows:—

Grounds, buildings, machinery, patterns, moulds and plant with rights in water power and leases, situated at Beauharnois, P. Q.

The patterns and moulds comprise, viz:—

A. Patterns and moulds for the celebrated "New Star Boiler" from No. 0 to No. 10, and all connections.

B. Patterns and moulds for the "Canada Improved" Radiators, 20 to 45 inches, plain and ornamented.

C. Patterns and moulds for Soil Pipe and soil pipe fittings in sizes 2-in., 3-in., 4-in. and 6-in. in light, medium and extra heavy.

D. Patterns and brass moulds for full assortment of the "Star" steam fittings.

The whole of the above to be sold en bloc, the purchaser to buy at cost price all material and goods manufactured, both at Beauharnois and at the warehouse, 1356 Cadieux Street, Montreal, consisting principally of "Star" Hot Water Boilers, parts and repairs.

Of the Star Boilers in the City of Montreal alone, there are in actual operation 6,000. This should justify good and profitable results in the sale of parts and repairs.

All information can be had, and the factory can be seen in operation by addressing the Liquidator.

week by a deputation from the St. Thomas shops, consisting of chief shop foreman, G. W. Cook; J. H. O'Toole, electrical foreman, and H. V. Martin, and presented with a diamond ring, a gold-handled umbrella, and a suitable address, on behalf of his former associates. Mr. Griffiths' departure from St. Thomas was so sudden the employees were unable to make the presentation before he left.

Catalogues

The Shaw Electric Cranes are fully described and illustrated in a handsome new catalog which this company has published. The general construction of these cranes is carefully explained, special reference being made to some of the principal features embodied in the design. The catalog contains several excellent photographs of installations in railroad and other shops, also of trolleys, motors and other details. Manning, Maxwell & Moore, Inc., Buffalo, N.Y., sales agents for the Shaw cranes, will be pleased to send copies to interested readers.

The Canadian Allis-Chalmers, Ltd., Toronto, have sent us a copy of their new catalog No. 133, devoted to mechanical power transmission machinery. The catalog contains illustrations and descriptive matter of practically everything relating to transmission machinery, too numerous to mention in detail. The tables of dimensions and other data accompanying each item are sufficiently complete for the use of purchasing agents and others. An interesting feature is the collection of tables, etc., selected from engineers' hand books, all useful for transmission calculations. The catalog is attractively bound in stiff cloth covers, with clean cut illustrations on almost every page. The reading matter is well arranged and comprehensive. Copies will be gladly sent to interested readers.

The Way to the Job Higher Up

The manager of the largest concern of its kind in Canada recently gave our circulation representative a pass and permission to interview members of their mechanical staff.

This was done because the manager realized that the man who reads his technical paper is more efficient than the man who doesn't.

And the efficient man is the best paid, the most ambitious, and in the end is found at the top of the ladder.

Study your paper carefully and apply the knowledge in your daily work. Keep your subscription renewed so that you will not miss one issue.

The date on the label of your wrapper shows when your subscription expires. **Less than four cents per copy**—two dollars a year—will renew it. Do it promptly in your own interest.

CUT GEARS

When you want a gear cut you want it quickly. We emphasize our promptness without sacrificing accuracy.

SPRING WINDING MACHINES

for wire up to 3-16 in. diameter. For springs of any length or diameter, either open or closed. A small machine but a big time and money saver.

Hand Power BENDING TOOLS

for blacksmiths, machinists and concrete workers. For making angles, eyebolts and concrete reinforcements.

A. E. WHITEHOUSE, 76 St. George St., Montreal

MACHINERY REPAIRS

When a break-down occurs in your factory, necessitating repairs, a temporary "tie-up" is inevitable in almost every case.

In a busy plant, "tie-ups" are expensive. We appreciate this fact, and when called upon, "get on the job" **without delay** and remedy the trouble quickly.

Try us—you will find our prices right, our workmen courteous and obliging, and our service unexcelled.

Can be done accurately and profitably on

B. & S. PLAIN SCREW MACHINES

There is a wide field of usefulness for these machines in every shop manufacturing machine tools, heavy machinery, or automobiles. Plain and irregular pieces can be handled with equal facility, and work can be rapidly produced, owing to the convenient arrangement of all parts which enables the workman to operate the machine quickly.

We build these machines in three sizes.

Send for a copy of our general catalogue, giving specifications of all our screw machines and other machine tools.

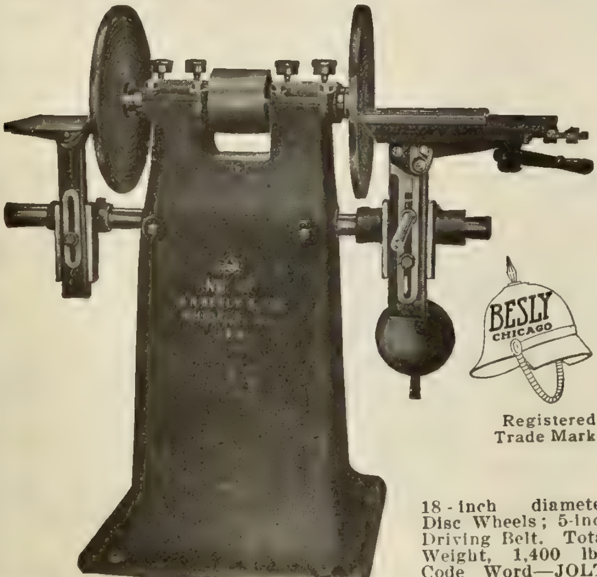
The World's Most Popular DISC GRINDER



Registered Trade Mark

18-inch diameter Disc Wheels; 5-inch Driving Belt. Total Weight, 1,400 lbs. Code Word—JOLT.

NO. 10-18.—G. BESLY GRINDER.

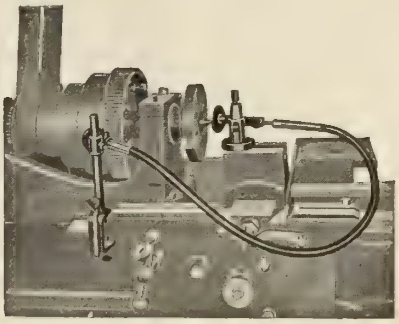
For general Fitting and Finishing, and Manufacturing operations, requiring 18-in. diameter disc wheels.

One of the most useful tools known to machine shop practice.

Costs only Six Cents a Day for Interest on Investment. Ask us for Details.

Charles H. Besly & Co.
Chicago, Ill., U.S.A.

Canadian Agents:
Williams & Wilson, Montreal. H. W. Petrie, Ltd., Toronto.



CENTER GRINDER

(Improved)

CHEAP! PRACTICAL! DURABLE!

The most popular tool of its kind on the market. Adjusted in a moment. An occasional use will keep your Lathe centers in perfect order.

Stow Mfg. Co.
Binghamton, N.Y., U.S.A.
Chicago Office 106 So. Jefferson St.

The Service-Giving Qualities of Our

No. 2 Buffing Machine

Mean Practical Economy to Every Shop

The SELF-OILING Bearings are babbited. Spindle is of steel, turned and ground to size.

Spindle can be made with tight and loose pulleys if desired.

Removable taper point is fitted to right hand end.

Accuracy Guaranteed

It will be to your interest to get full particulars.

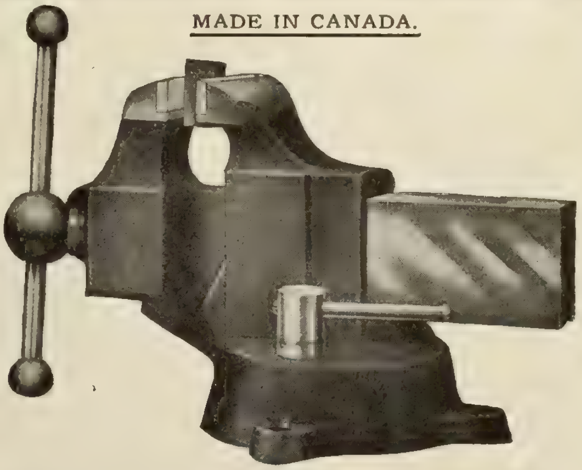
Catalog on grinding and polishing machinery?

J. G. Blount Company
Everett, Mass., U. S. A.

The YOST

Solid Jaw and Swivel Bottom Machinist's Vise

MADE IN CANADA.



A vise with a grip like grim death; a durability that defies time and the hardest usage.

A vise that will give you a lifetime of perfect service and satisfaction. The metal in a Yost Vise is of faultless quality, perfectly distributed and the workmanship is

Incomparably Good

The National catalog would certainly interest you. Write us, asking for a copy.

National Machinery & Supply Co., Ltd.
HAMILTON - - ONTARIO

This Guarantee Goes With Every Vise: We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

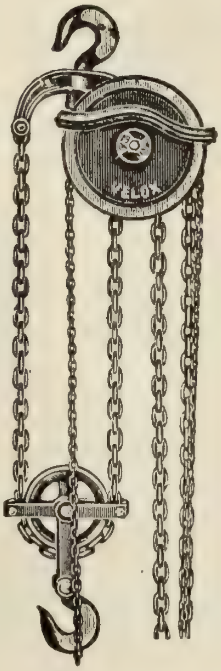
MOTORS

3000 Machines in Successful Operation
REPAIRS TO ALL MAKES

294-300 Adelaide Street West
Toronto, Ont.



THE BEST WAY
to handle from ½ ton to 5 ton is with a

Velox Chain Block

It will always run easily, smoothly, and quickly.

You can lift and support a weight, at a given height more quickly and with less effort whenever you use a Velox.

HIGH SPEED
BRONZE BEARINGS
ALL STEEL CUT GEARS
ALL PARTS DUST PROOF
HIGHEST EFFICIENCY.

Write for particulars.

ALFRED H. SCHUTTE
90 West Street, NEW YORK.

Montreal Toronto

Use the Oil Engine for Power

Where an adequate supply of oil is available, the Fairbanks-Morse Oil Engine has many striking advantages over any other type of engine for power. Some of these advantages are portability, cleanliness; automatic operation, requiring no licensed engineer or skilled attendant; low fuel cost; no expense when not running; absolute safety, no danger from fire, and thorough reliability.

FAIRBANKS-MORSE OIL ENGINES

Will operate successfully on 72 per cent. of the oils distilled from the average crude.

These engines are built in all the common sizes from 2 horse-power up.

The usual excellence of design, careful workmanship and superior materials enter into the construction of Fairbanks-Morse Oil Engines, guaranteeing their service.

Many plants in Canada are now operating our Oil Engines. You will find it to your interest to get in touch with us. Ask for Catalogue 52.

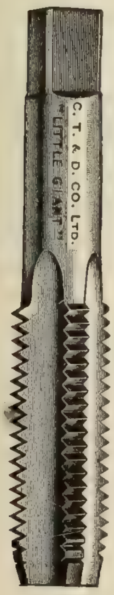
This Trade Mark
Means Much to the User of

TAPS



It is our positive guarantee of maximum service.

Any taps or dies bearing this mark failing to give you better service, can be returned to us and we will immediately cancel all charge against you.

Try them — if they are not better send them back — fair offer, isn't it?

Order now. We will be pleased to send our illustrated catalog.

THE CANADIAN TAP & DIE CO., LIMITED
Little Giant **GALT, ONTARIO, CANADA**

Issue "Nicholson-made" Files

THESE brands of files sell over 200,000 a day —unique and alone in bulk of trade.

If your factory issues a Nicholson brand as your shop file, your workmen are insured almost unvarying high-quality filing. The action and "feel" are constant and unchanged from lot to lot of Nicholson-made files. Each file that reaches you is hand-tested.

Besides that, special steels, special machines, and special hardening methods exclusively Nicholson, give the greatest file value your money can buy. At all jobbers.

Nicholson-made Brands: American, Arcade, Eagle, Globe, Kearney & Foot.

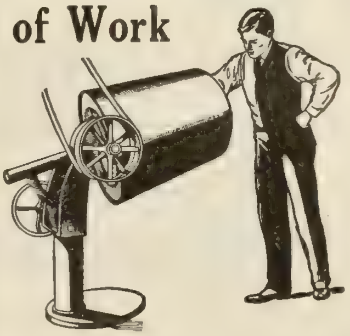
Many Kinds of Work Tumbled With One Barrel



THE old fashioned barrel that did only one kind of tumbling, and not very well at that, is a relic of bygone days, despite the fact that there are still some firms who continue to use it.

But the farsighted plants who demanded maximum efficiency in every department readily saw the disadvantages of these horizontal barrels and installed instead

GLOBE TUMBLING BARRELS

And where it formerly took various types of barrels for various kinds of work, one Globe Barrel is handling it now because it can easily be adapted to gentle, violent or medium tumbling by simply changing the angle at which it is running.

With Globe Barrels there is no guess work—no chance of tumbling a job longer than it need be. The work is always visible and the operator can inspect it without stopping the barrel or removing a lid.

8 stock sizes—$50 to $170. If you haven't received a copy of our new tumbling catalog No. 2—Write for a copy now.

Long Service is a Natural Result of The "Twisted-While-Hot" Process

It must be annoying to the average drill user to have drills made from well known brands of steel fall down on the job. He wants efficiency and can secure it by adopting "Hercules" High Speed Drills.

"Hercules" High Speed Twist Drills

are made from a High Percentage Vanadium High Speed Steel under the only "twisted-while-hot" process that retains all the strength of the steel in the finished drill. The grain of the steel is undisturbed, insuring longer edge-holding and greater resistance to the strains of the metals having different degrees of hardness.

The taper shanks, usually one size larger than ordinary, prevent tang troubles and give a greater driving power because the drill fits into the chuck firmly and in the centre.

Your jobber will supply them or you can send order direct. Send for Catalog No. 82-G.

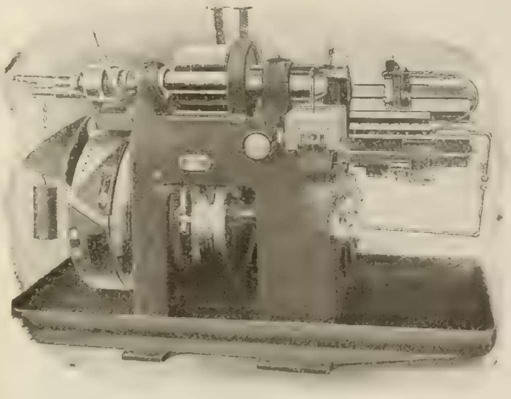
☛ TYPE "SS-2"

Away—from the old type Turret

Away from the old-fashioned box tool holder secured only by its shank. Away from the long overhang of cutting edge from point of support. Away from the springing and chatter of insecurely held tools. In the

"Gridley Single Spindle Automatics"

the old type vertical turret is gone. The tool holders of rigid design are bolted directly to the special "Gridley" Turret, which revolves on a horizontal axis, and whose long stem is carried in bearings at both ends of the machine. The cutting edges of the tools are, at all times, **directly over their points of support,** and the method of mounting the turret distributes the cutting strains to the body of the machine where they can do no harm. Gridley construction facilitates tools being mounted tandem for bar and shoulder work.



"GRIDLEY" Single Spindle

There are many other points of interest. Our book, "Gridley Automatics," tells all about them.

We make both Single and Multiple Spindle Automatics.

Cut Labor Cost

Rockford Drilling Machines

Greatly Increase Production

Rockford Gang Drills are really vertical lathes, but their value is in their ability to use the operator's time to the greatest advantage. With this machine in your shop the operator will have no idle moments, but will be turning out more work and increasing your profits.

By proper Jigging and Tooling of the machine, gauging the number of spindles per operator to the time required for the longest operation, and in the loading and unloading of pieces, the Gang Drill can be made one of the most valuable machines in the shop.

Our Booklet, "Jigging and Tooling," is the only one on the subject ever issued, and it contains facts in which every manufacturer will be interested.

It will cost you nothing but a post card. Write now.

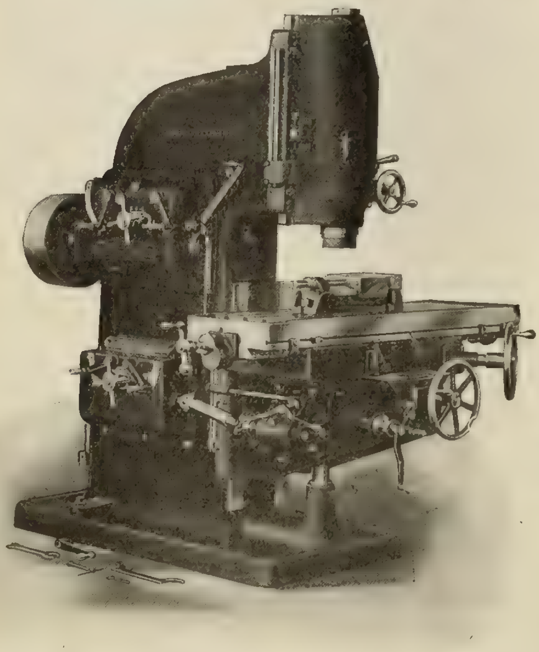
High Power Vertical Cincinnati Millers



are made in 3 sizes—28", 34", and 42" table travel, and of 5 h.p., 7½ h.p. and 10 h.p., respectively

Heat Treated Alloy Steel Gearing; locked tumbler; treadle for quick speed changing; direct reading feed and speed index; quick pitch feed screws; single plunger trip; feed levers control reverse and always indicate which way the table will move; sight feed oilers. THE SPINDLE HEAD is made in large proportions—see illustration; head can be securely bolted to the column when doing heavy milling. THE DRIVE is always through the main gear close to the lower bearing. THE SPINDLE BEARINGS are always the maximum distance apart.

Because of all these features these machines have greater cutting capacity than other Verticals of equivalent size.

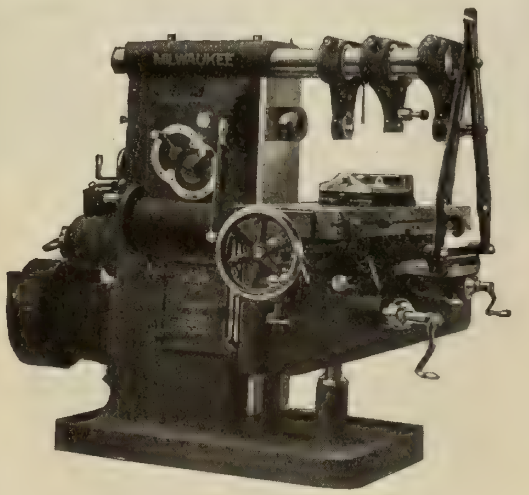
The Cincinnati Milling Machine Co.

Canada Agent: H. W. Petrie, Ltd., Toronto, Montreal

CINCINNATI, OHIO, U.S.A.

WHY MILWAUKEE MILLERS *Are Built Exactly As They Are*

No 12—Arrangement of Operating Handles



The question of the convenience with which the workman can operate the machine is one of the points to be most carefully considered by the milling machine user because of its direct bearing on the important subject of "speedy production."

A rigid machine such as we have shown the Milwaukee to be, with strong drive and powerful feed, such as we have shown the Milwaukee to possess, will take fast and heavy cuts—

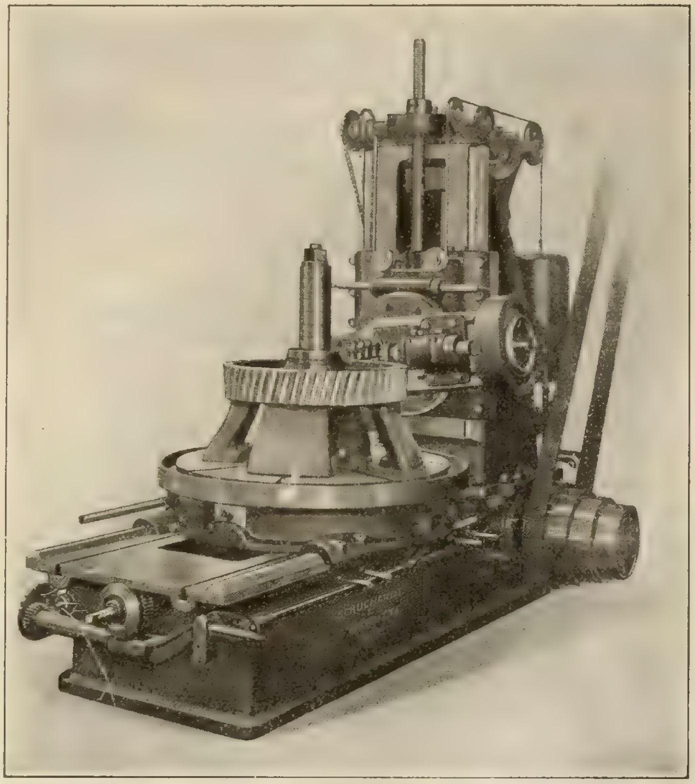
But maximum results can be obtained only when careful consideration is given to the location and arrangement of operating handles, enabling the operator to keep the cutters at work with least possible delay between cuts.

In the illustration shown herewith you see every lever and handle of Milwaukee Millers, and you can judge for yourself as to their convenience. Not one handle is on the opposite side of the machine, with the exception of the handles for reversing speed and feed.

This is the twelfth "WHY" showing the important points in favor of Milwaukee Millers. Our Bulletins give them all, considerably amplified, besides other details which will interest you. May we mail you copies?

KEARNEY & TRECKER CO., MILWAUKEE, WISCONSIN

Canadian Agents—A. R. Williams Machinery Co., Toronto, St. John, Winnipeg, Vancouver; Williams & Wilson, Limited, Montreal



The Correct Way To Cut Gear Teeth

accurately is by the generating method, and it is also the most economical way.

Over 2,000 leading concerns will tell you the S. & S. process of producing clean cut, accurate Gears, Spur, Worm, Spirals, etc., is not only superior to any other process they have ever known, but that **S. & S. Hobbers** will turn out work more quickly and more profitable.

Our illustrated catalog goes into details. Your name adds you to our mailing list for Free Monthly Bulletins. Write us to-day.

Schuchardt & Schutte, 307 Coristine Building,
MONTREAL, QUE.

For Accurate Screw Cutting

on Turret Lathes and Automatic Screw Machines, the

GEOMETRIC SELF-OPENING AND ADJUSTABLE DIE HEADS

have no equal.

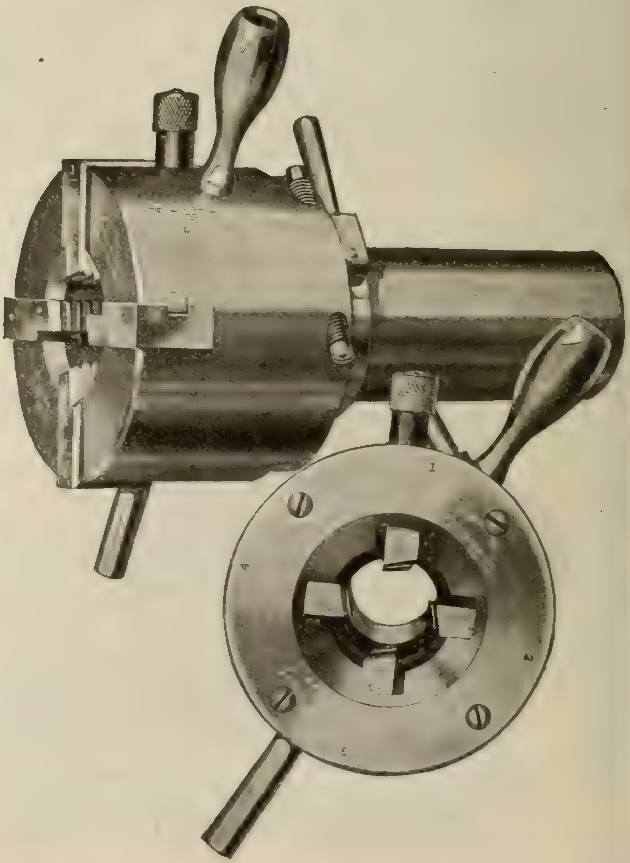
They have met and overcome every difficulty

The Die Heads are strong and substantial—fitted with correctly hobbed chasers. These chasers can be reground and used over and over again. When entirely worn they can be replaced at slight cost.

Each Die Head will accommodate a good range of diameters, by the use of extra sets of chasers. And there is no plate or cap to be removed when the chasers are changed.

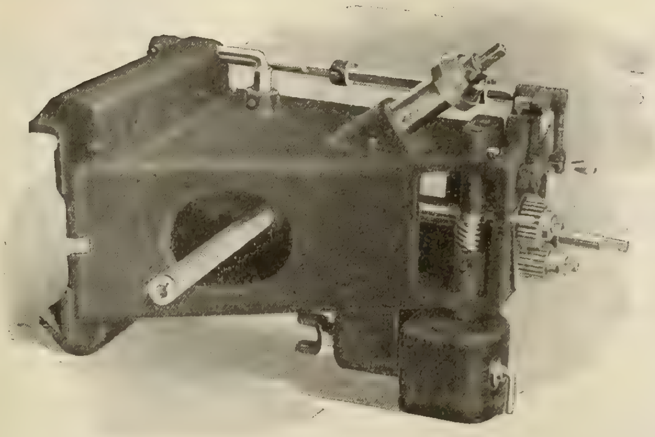
Any length of thread can be cut that the travel of the turret will permit.

Send for Catalogue of our Style "D" Die Heads.

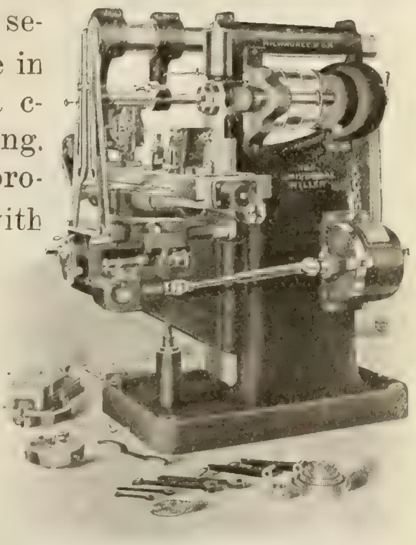


The Geometric Tool Co., New Haven, Conn.

Canadian Agents: Williams & Wilson, Montreal. The A. R. Williams Machinery Co., Toronto



The KEMPSMITH MASSIVE KNEE



helps the milling machine to stand up to steady, severe service in manufacturing milling. Generous proportions, with abundance of metal thrown where it is most needed—for instance, around the bearings on the column. Se also the length of these bearings. The whole machin is built along the same massive lines.

Built in "The Model Plant for Specialized Machine Manufacture."

KEMPSMITH MFG. COMPANY, Milwaukee, Wis.

LeBlond Heavy Duty Lathes

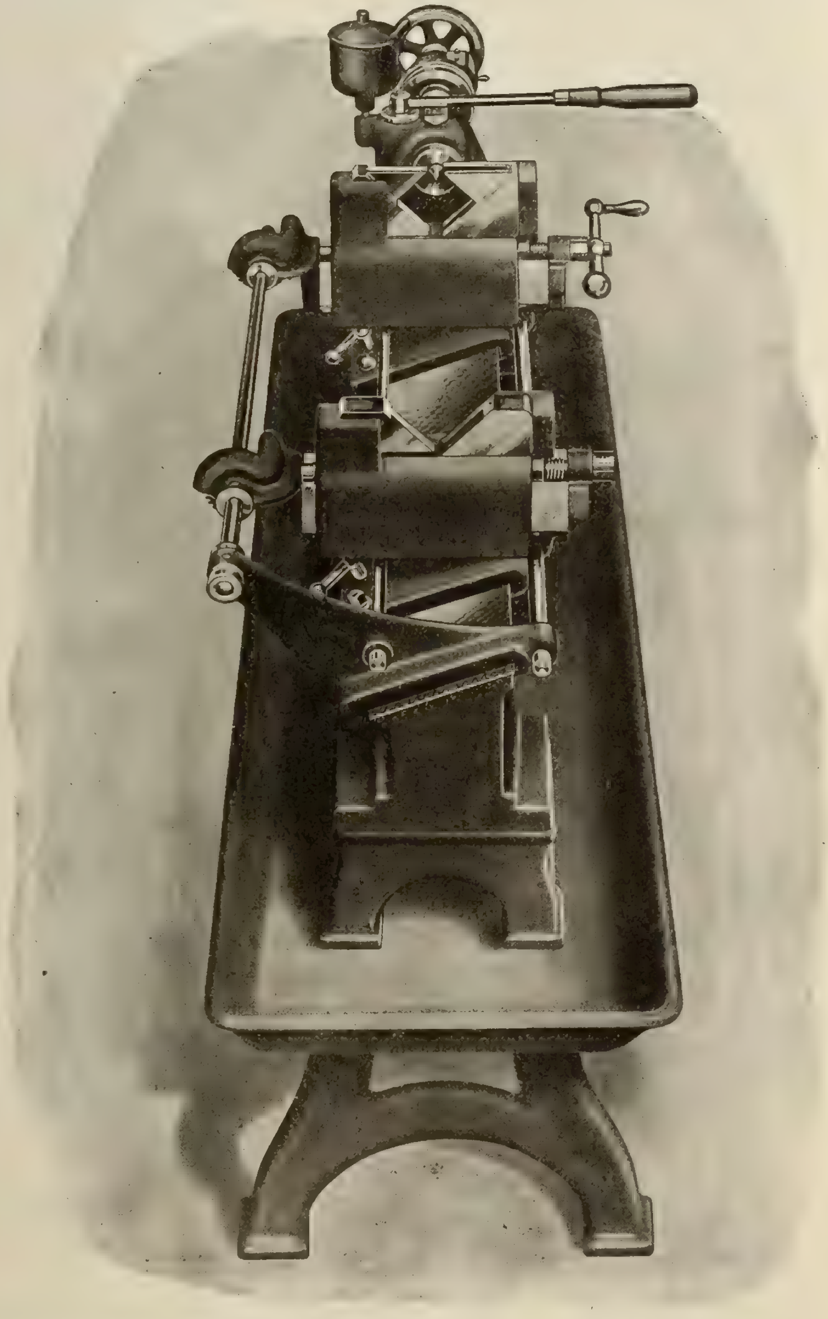
The UNION ENGINEERING WORKS OF TOOL MACHINES

CHEMNITZ, in SAXONY

The largest special manufactory for the construction of Boring and Milling Machines

"Hendey" Centering Machine

Made to meet the demands of those who want a machine that will centre within reasonable limits of accuracy, and amply proportioned in spindle bearings, etc., to withstand wear and tear.



Head and Spindle Construction. The head is rigidly clamped to the bed, giving permanent alignment of spindle. Spindle is large in diameter with ample bearings, front journal being made taper after the well known pattern of the Hendey lathe head. Thrust taken by ball bearing. Spindle carries watch tool chuck for accurately and conveniently holding combination centre drill and reamer. One motion only to get center. Back locking pin working in flange of pulley is provided for use when necessary to remove or replace centre drill.

Jaws of Vise and supporting block are hardened and ground.

Alignment of Spindle with Jaws. Jaws are aligned from spindle by proof bar carried in spindle. This care in alignment is exercised in order to enable machine to accurately centre stock for finishing purposes after coming from turret lathe or screw machine.

Relative Movement of Vise and Block is maintained by means of the connecting rod and bevel geared drive at back of machine, controlled from the one ball handle at front of vise. This means that, no matter what the diameter of the bar may be within the limits of the machine, it will **always be supported in a horizontal position,** there being no hand adjustment and ''eye-alignment'' necessary for back support.

Inclined Surface of Bed, sloping away from operator, tends to direct the chips into the pan, rather than have them accumulate around the head, necessitating frequent cleanings when it is desired to shift vise carriage.

Saddles are gibbed and fitted to bed, and provided with binding handles for ready clamping in position.

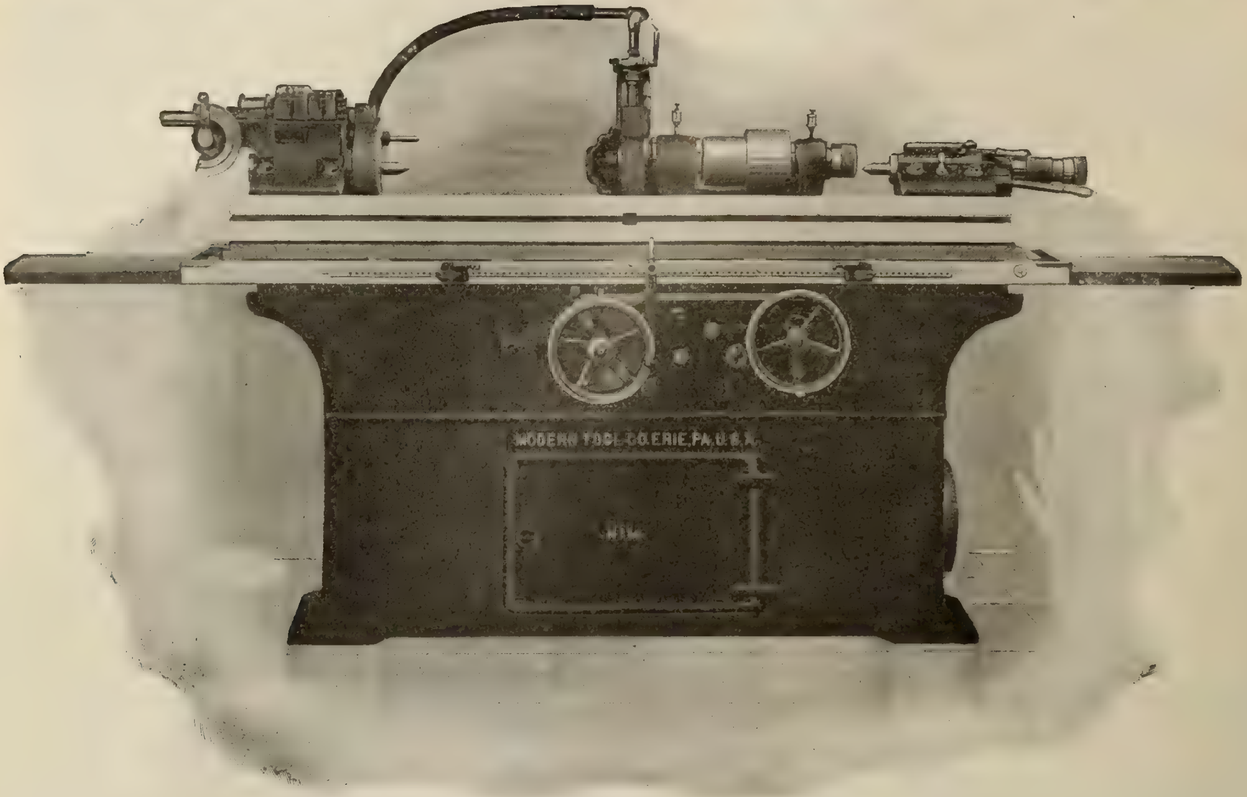
Heavy Parallel Bars, running the length of machine, serve the two-fold purpose of a rack for carrying stock to be centered, and, in connection with the inclined bed, prevent it from being bruised and banged through common use of bed as temporary support for the stock.

Capacity of Machine is from 5-16 to 4 inches, inclusive.

The Hendey Machine Company, TORRINGTON, CONN.

CANADIAN AGENTS: A. R. Williams Machinery Co., Toronto, Ont.; A. R. Williams Machinery Co., 260 Princess St., Winnipeg; A. R. Williams Machinery Co., Vancouver; A. R. Williams Machinery Co., St. John, N.B.; Williams & Wilson, Montreal, Canada.

MODERN GRINDERS



No. 14 Plain. Capacity 12-in. x 44-in. Wheel 2-in. x 18-in.

Great strength and rigidity is assured by the heavy base with metal flowed correctly to absorb vibrations and prevent springing.

Accessibility—the driving and reversing mechanism is contained in a bracket bolted to the outside of the machine. Instantly accessible for oiling and repair.

Large wearing surfaces—all wearing surfaces are large and located away from grit and water.

Automatic cross feed gives a range of from .00025″ to 004″.

Changes—the work can be stopped or started—changes of work speeds made instantly, by use of lever on head stock.

Modern Grinders are built in Plain, Universal and Internal types. Unexcelled in accuracy, speed and durability.

Write for catalog immediately.

MODERN TOOL COMPANY

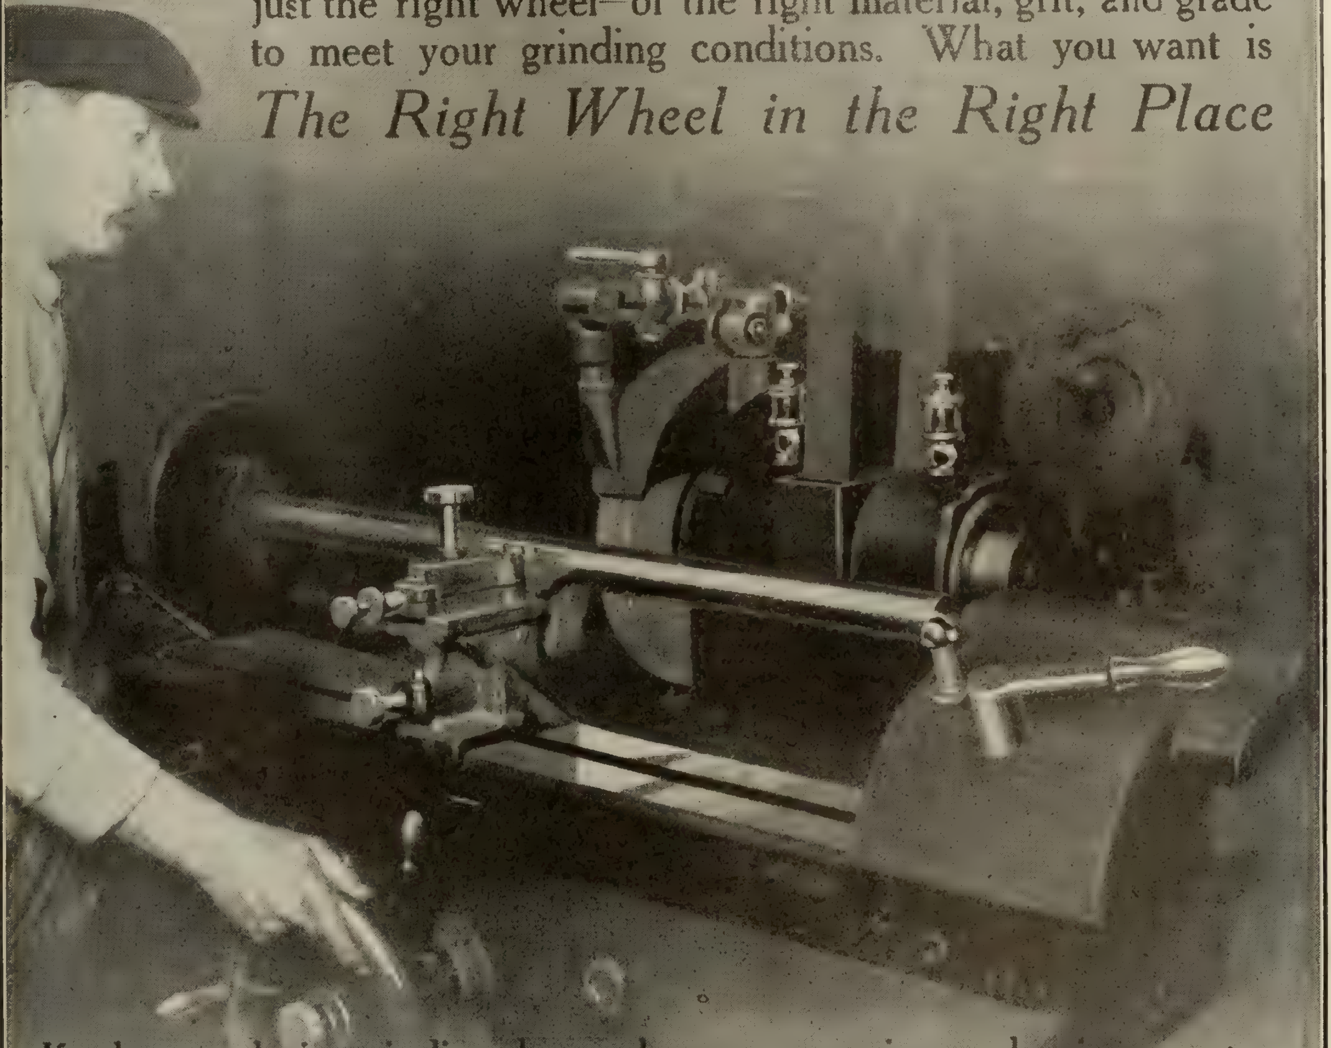
State and Peach Streets **ERIE, PA., U. S. A.**

The Grinding Machine is Only as Good as its Grinding Wheel

No matter how good a grinding machine may be, *the grinding wheel* is the all important factor which limits its production and determines the quality of its work.

There is false economy—lost efficiency—in not having just the right wheel—of the right material, grit, and grade to meet your grinding conditions. What you want is

The Right Wheel in the Right Place



If the work is grinding brass, bronze, cast iron, aluminum, etc., *Carborundum* is the wheel.

If you are grinding high speed steel, manganese, high carbon or steel of any quality, *Aloxite* is the wheel.

Our service department will see to it that you get just the wheel you should have—the right wheel in the right place.

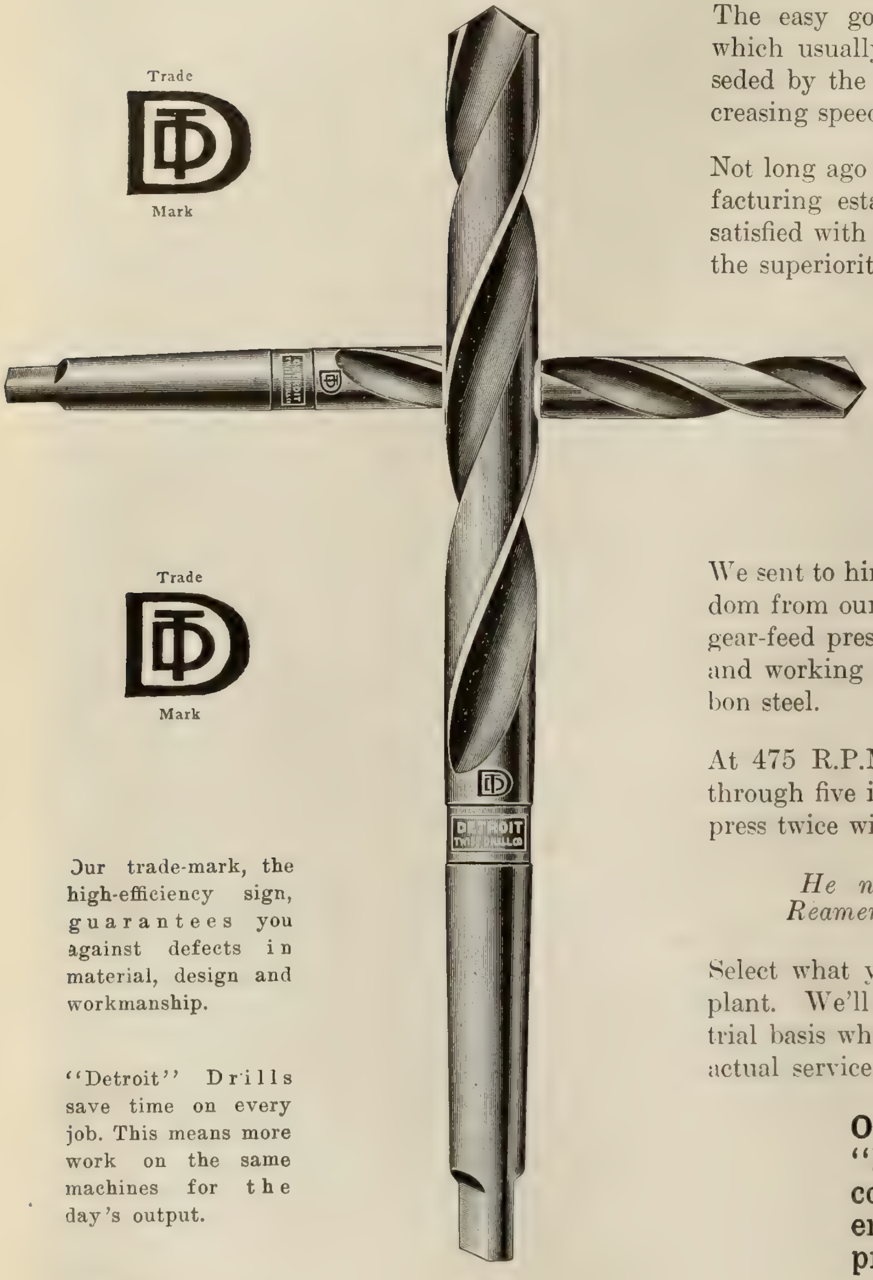
Trade
Mark



The easy going, "let well enough alone" policy, which usually leads to stagnation, has been superseded by the modern, insistent demand for ever increasing speed, accuracy and high efficiency.

Not long ago the Factory Manager of a large manufacturing establishment told us he was very well satisfied with the drills he was using and questioned the superiority of

"DETROIT" HIGH-SPEED DRILLS

We sent to him for trial a ¾ in. drill selected at random from our stock. He put it in one of his largest gear-feed presses, capable of handling 2½ in. drills, and working in an old hammered die block of carbon steel.

At 475 R.P.M. and with .018 feed the drill went through five inches of the work and stalled the drill press twice without the slightest sign of wear.

He now uses "Detroit" Drills and Reamers exclusively in his entire plant.

Select what you want for a good stiff test in *your* plant. We'll ship them on our "guaranteed good" trial basis which means that they *must* convince by actual service, or cost you nothing.

Our New Catalogue "R" arranged in two colors for ready reference — is just off the press.
Ask For It.

Trade
Mark

Our trade-mark, the high-efficiency sign, guarantees you against defects in material, design and workmanship.

"Detroit" Drills save time on every job. This means more work on the same machines for the day's output.

Comparative tests have proved that "Detroit" Drills cut from 8 to 30 inches more metal per grinding than other makes.

Look for the trade-mark. Write to-day.

The Drills That Stand The Test

"Hercules"
High Speed Drills

Trade Mark W&B **Tools of Quality Bear These Marks** W & B **Trade Mark**

Made from High Percentage Vanadium High Speed Steel under a "twisted-while-hot" process of our own, which preserves the strength and grain of the steel, "Hercules" High Speed Drills possess longer edge-holding and greater strain-resisting qualities than is possible with any other High Speed Twist Drill made.

The working capacity of "Hercules" High Speed Drills is limited only by the speed of the machine in which they are used. This means an output equal to the shop maximum.

Try a "Hercules" under any condition you please, and compare its performance to the drills you are using at present—you will find it to be just what we have proven—the best drill that can be made.

Jobbers and Dealers everywhere will furnish. If you are delayed in having your orders filled, write us and we will see that you are supplied.

Ask for Machinists' Supply Catalog No. 82-F, showing complete line of High Speed Drills.

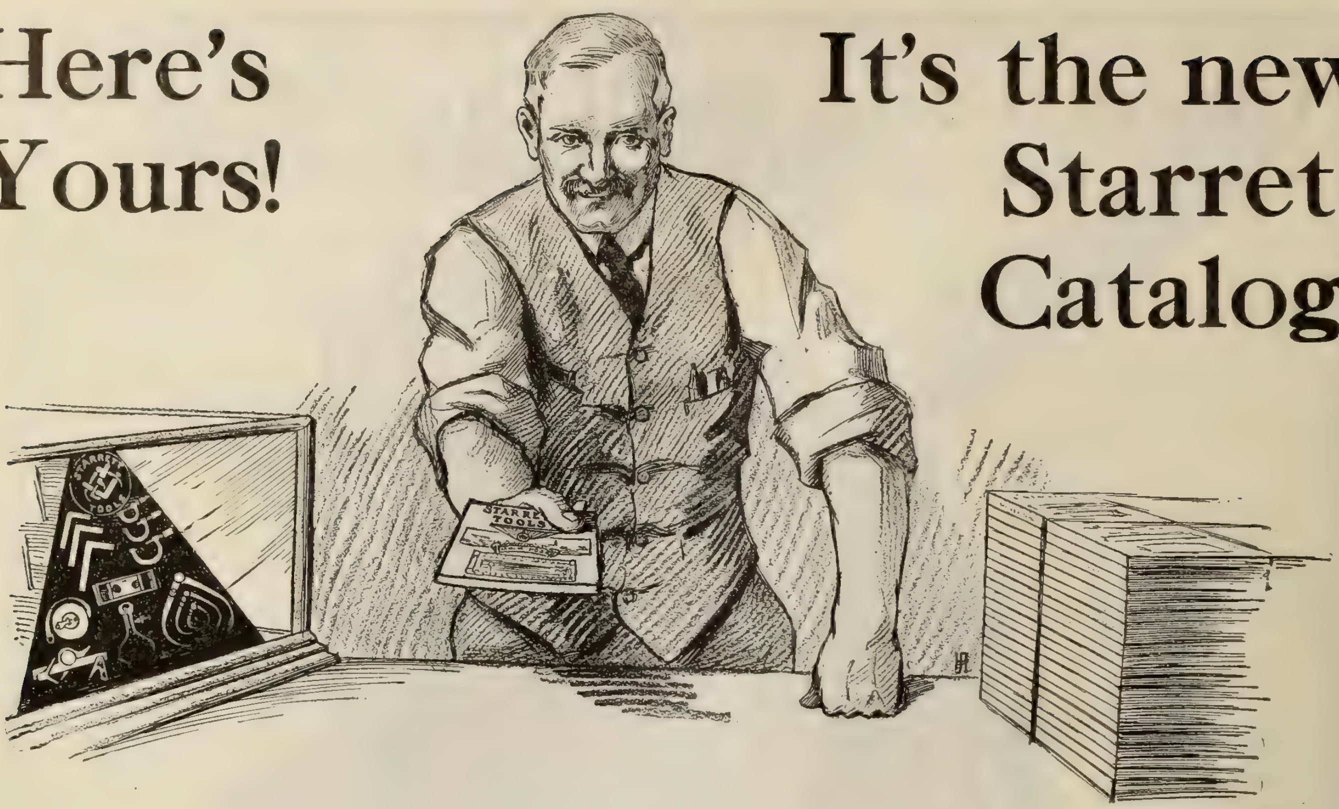
Here's Yours!

It's the new Starrett Catalog!



Every man who is interested in "Canadian Machinery" will also be interested in the new Starrett catalog No. 203 just off the press. It is the most complete catalog of mechanical tools ever published. It describes, illustrates, and gives prices on more than 2100 styles and sizes of tools, of which the majority are for machinists.

You cannot afford to pass up this catalog. You can never tell when you will want to know the price on a micrometer or test indicator, or what tool is available for a special job. With the Starrett catalog you can find out just what you want to know in short order.

This catalog is arranged for quick reference. It contains indexes of the tools by name and by number. Besides the straight descriptions and prices this catalog contains practical information on the use of many of the more important tools. There are also tables of data and information which add to its value.

We want to send YOU a copy of this catalog. Send us your name and address and we will mail you a catalog immediately. Ask for catalog 203.

Quality and Quantity

are both desirable when finishing dies, discs, thrust collars or piston rings. One machine may produce Quality and another Quantity, but you get both at the same time on the

Heald Piston Ring Grinder

As proven by long experience in hundreds of shops, both in this country and abroad. It is without an equal for finishing such parts rapidly and accurately to thickness.

Rigid construction, accurate micrometer feed of the chuck toward the grinding wheel, and simplicity of operation are responsible for its success.

The periphery of the wheel is used in grinding which gives a quality of finish that cannot be obtained by the use of a cup wheel.

The extreme simplicity of this machine makes it easy for a boy to operate.

Our catalog will tell you in detail many other advantages that this machine embodies, which we shall be pleased to send you if interested in this work.

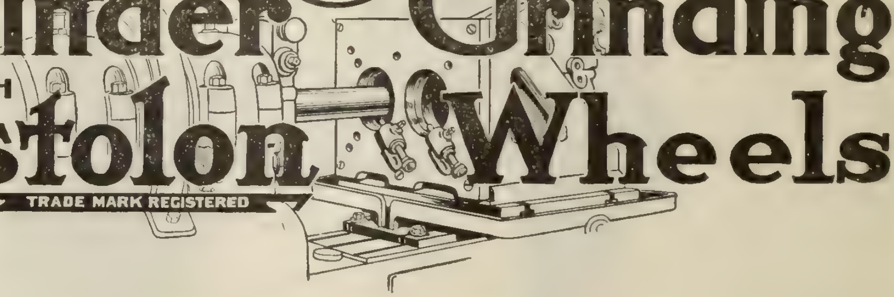
TRADE MARK NORTON REGISTERED

Cylinder Grinding with Crystolon Wheels

TRADE MARK REGISTERED



On cast iron—and brass, bronze, etc., Norton Crystolon wheels give large production plus the fine finish required in the internal grinding of such parts as the sleeves for "Silent Knight" engine valves. In cylinder grinding, where the right fracture of grain and the right clearance are prime factors of wheel structure, Norton Crystolon wheels are producing unexcelled results.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our warehouse in all current sizes, flat, squares and rounds; annealed and unannealed.

Turn Your Hack Saw Troubles Over to the "VICTOR"

FOR cutting Soft Steel, Cast Iron, Machinery Steel, Wrought Iron, Shafting, etc. 1. In a hand frame a 14 pitch No. 1 or No. 2 VICTOR. 2. In a light power machine a 21 gauge regular No. 4 VICTOR. 3. In a heavy high speed machine an 18 gauge regular No. 4 VICTOR—**ARE UNSURPASSED.**

For every metal that you want to cut there is a Victor Hack Saw **especially designed for exactly that purpose.** This does not mean a confusing number of blades—it simply means a scientific solution of your hack saw troubles. **Examine our price lists of**

VICTOR HACK SAWS

No matter **what** the job you can pick out **the right** saw at a glance. This means an **end** to big breakage—an **end** to stripping teeth—an **end** to inefficiency. Turn your hack saw troubles over to the "Victor."

As much money is spent to-day in merely INSPECTING Victor Hack Saws as many old time makers used to spend in the process of manufacture.

Send for Price List.

VICTOR SAW WORKS, Limited, Adam Street, Hamilton, Ontario

NICHOLSON FILE CO.

The Real Value of a File

THE real value of a file is its ability to preserve full efficiency for the labor that uses it. A file at 15, 20, 25 or 30c really represents $3.00, $4.00 or $5.00 of labor time on your payroll. A worn 15c file may demand $5.00 in labor time, where a new 15c file would only need $2.50 in labor time for the same work. See files are sharp. See each file has so many hours' work only, and no more. Replace files promptly and continuously. The decrease in your payroll will be much greater in cash than the increase in your file account. Sharp files pay.

"Nicholson-made" Files are sharp-toothed swift-cutting tools, made from private steel, and hardened by private processes. They are unique among files — different. They are sold all over the world. Instal them in your shop, and consume them generously for the sake of shop efficiency.

Ten Years Per Drive

The six chain drives shown, together with twelve others in the same shop, have now been in service since 1903, and are still in good condition and capable of much further use. A total of thirty-one (31)

MORSE Chain Drives

were installed in this shop at that time on old redesigned tools, and to date show an average of 8½ years per drive. The evidence in favor of MORSE Silent Chain Drives for YOUR machines is now complete, to wit:

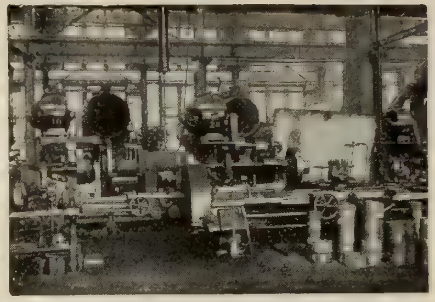
Efficiency—99%, sustained at all times, regardless of conditions of service.

Durability—Each drive should last at least three years (the average is shown to be much higher), or long enough to pay for itself by the saving of power.

Reliability—Installed right, they need never come off the sprockets. They don't part or break as do belts. Require very little lubrication and practically no attention.

Economy—Any drive that will pay for itself before worn out is an economical proposition regardless of first cost.

Everything considered, MORSE Silent Chain Drives will prove best for YOUR machines, more efficient, more durable, more reliable, and more economical. You can't afford longer to be without them. Write us for full particulars to-day.



42 in. Niles, and 25 in. and 20 in. Putnam Lathes driven by the same Morse Silent Chains installed in 1903.

Three more lathes in the same shop as those shown above driven by Morse Silent Chains. None of these chains have been repaired.

"Clipper" Belt Lacers

TRADE MARK LACES IN THREE MINUTES

In 21 Calls In Montreal

Canadian Manufacturers are wide awake. They see quickly how time-saving is money-saving. The

"Clipper"

laces a belt in 3 minutes or less, as against 10 to 20 minutes the old way with rawhide. This saving in machine-time and labor-time, and the consequent increase of output will pay for the Clipper in a week, in some plants; in a month in many plants.

How It Works

Any strong boy can do it—simply insert a card of hooks into the machine and by pressing the handles, sink this whole row of steel hooks into the belt-end. Do the same with the other end, then join the two over the pulley by inserting our "Fibro" pin.

You don't have to remove belt from shaft, as the machine weighs only 19 lbs., and can be carried to the broken belt.

We are establishing Jobbing Connections all over Canada, and

can supply a machine duty-paid for $20.00 through any of these dealers.

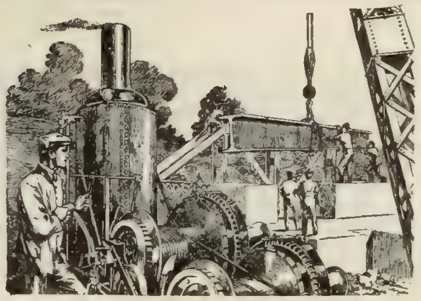
Free Trial Offer

To demonstrate the value of this machine at our risk and expense, we have authorized our Canadian Dealers to supply any manufacturer who requests it, a Clipper Belt Lacer and a quantity of lacing hooks on a 30 days' free trial basis.

Give us name and address of jobbers or mill supply house from whom you buy belting and we will arrange to have him supply you a machine on this basis.

CLIPPER BELT LACER CO.

998 Front Ave., Grand Rapids, Mich., U.S.A.



A Frictional-Heat-Proof Lining For Machinery Brakes.

J-M Non-Burn Brake Lining grips the drum instantly, when the brake is applied, and makes it possible to stop the machinery almost instantly when emergency demands. Yet, by applying less pressure to the brake, motion can be retarded as slowly and smoothly as desired.

J-M NON-BURN Brake Lining

has proved to be the ideal brake lining for machinery brakes, clutches, pulleys, and other machinery requiring frictional contact, because it is composed of the long, tough fibres of pure Asbestos, reinforced with strong brass wires interwoven in each strand. It is not affected by heat from friction, nor weakened by grease, water or grit.

J-M Non-Burn is made in lengths, widths and thicknesses to meet all requirements.

MAGNOLIA ANTIFRICTION METAL

WOODWORKING MACHINERY

High Speed, Heavy Duty and Grit and Dust Make this Class of Machinery Very Trying on Babbitt Metals

We Have Many Testimonials, Besides Those Given Below Showing that **Magnolia Metal** is Ideal for that Service.

POUK MANUFACTURING COMPANY,
Chicago, Ill., Oct. 13th, 1910.

Gentlemen:—

I am using Magnolia for years for high speed Machinery—such as shaper bearings, 5,700 R.P.M. Have tried several other babbitts, but obtained best results with Magnolia.

If it comes to lining heavy loose pulleys and bearings for heavy shafts it is the one that lasts.

Respectfully,
F. A. SAWITZKE, Eng.

J. J. McGILLIVRAY,
Sash, Doors and Mouldings,
Black River Falls, Wis., March 31st, 1911.

Gentlemen:—

I desire to state that all the bearings of this Sash & Door Factory are lined with Magnolia. One planer has not been rebabbitted in **Fifteen years** and is in good condition to-day.

I always make it a point not to overheat the babbitt and stir thoroughly before pouring.

J. C. JOHNSON, Supt.

MARSHFIELD STAVE COMPANY,
Marshfield, Wis., April 4th, 1911.

Gentlemen:—

All bearings in this Factory are lined with Magnolia Metal. We have found it superior to all other metals for our plant: one planer running 3,000 R.P.M. or more has not been rebabbitted for several years.

Yours truly,
MARSHFIELD STAVE COMPANY,
Frank Mertle.

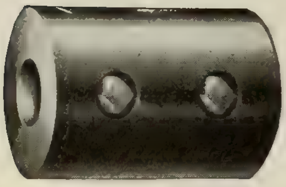
DODGE SOLID SLEEVE

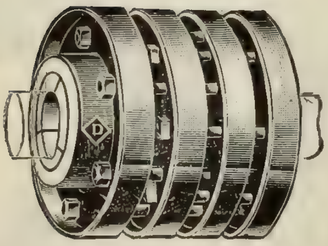


Solid Sleeve

A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.

DODGE KEYLESS COMPRESSION

Single Compression



Double Compression

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.

ARCTIC METAL

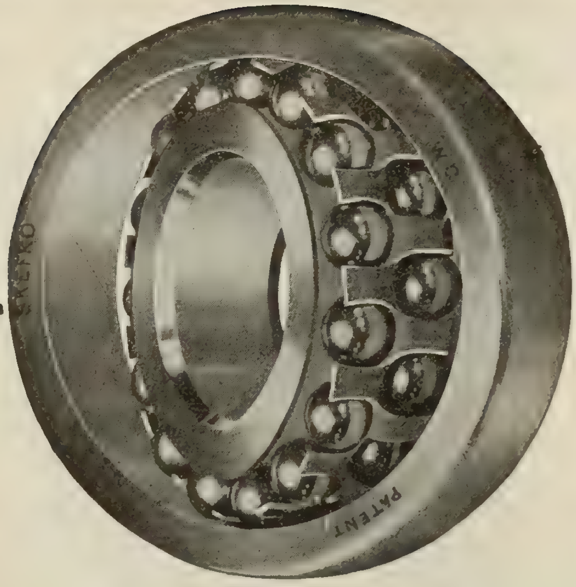
Why We make Arctic Metal

Because the consumers are looking for a babbitt that is always uniform; that will stand up under Heavy Pressure; that will keep cool under High Speed. The consumers have found these conditions in

Arctic Metal

Manufactured by

Tallman Brass & Metal Co.
HAMILTON, ONT.



Instantaneous Self-Alignment

The key to successful bearing operation is instantaneous and frictionless self-alignment. There is one famous make of ball bearings that possesses this all important feature—SKEFKO.

This instant adjustment is obtained by the novel design of Skefko Self-Aligning Ball Bearings. As shown above, the spherical outer race allows the inner race and balls to swivel out of their plane of rotation, thus providing for a frictionless self-alignment that automatically compensates for any deflection of shaft.

The value of this self-aligning feature is recognized in ordinary ball bearings, as they are frequently mounted in swivelling housings. The advantage of having this feature inherent in the bearings themselves, as in Skefko Bearings, is obvious, for the swivelling takes place on balls instead of on a solid bearing.

SKEFKO

"Self-Aligning Ball Bearings"

Eliminate friction, reduce wear, obviate repairs, increase the life of machines, require a minimum of attenton and cut down maintenance cost.

Skefko Self-Aligning Double Row, Double Capacity, Double-Life Ball Bearings cost no more than ordinary bearings, and are made in international standard sizes. Their use is practical under any load and speed condition.

We can show you where Skefko Ball Bearings will save power, attention and lubrication, and simultaneously increase your output and improve the quality of your work.

Your best interests demand that you investigate.
Ask us for "Skefko Bulletins."

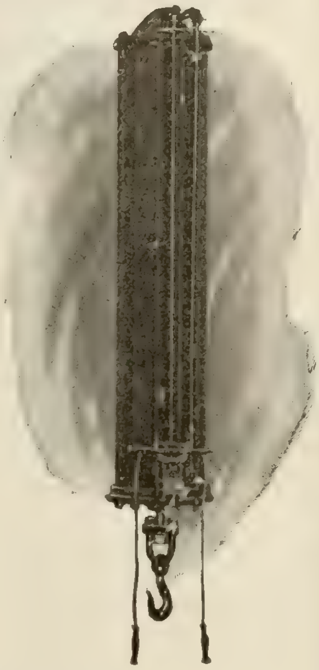
IT'S THE DESIGN,

WORKMANSHIP AND MATERIAL of the hoist that make it efficient.



Efficiency is the proportion between the energy applied and the energy derived.

A leaky valve or poor packing will allow a good part of the energy (compressed air) applied to the hoist to escape, thereby reducing the energy derived (lifting capacity) proportionately.

INGERSOLL-RAND AIR HOISTS

have valves of the direct lift disc seated type, which allow no leaking.

The valve seats are of brass as are the stems, the valves being faced with rubber, making an absolutely air-tight joint.

They keep this state of perfection for an extended period owing to their positive non-rubbing action.

The piston and rod are packed with an improved form of cup leather packing which adjusts itself automatically to suit the air pressure.

With INGERSOLL-RAND workmanship in them you can rely on these Hoists for the highest efficiency.

Men and Pygmies

If you start out to accomplish some particular thing in life, to live up to some high or noble purpose, you will always be criticised by those who despise success, by those who despise all good, by those who can see nothing in other men but that which they find in themselves.

¶ This world contains many men who have no high and noble purpose in life, to whom the ideals and ideas of others are but chaff, to whom there is no such thing as genuineness of character or sincerity of purpose. These men test all things by their own barometer; they measure the minds of other men by their own insincerity.

¶ If we await the time when we will not be held up to ridicule before attempting to accomplish a thing worth while, then nothing will ever be done. There would be no books, no telephones, no dramas. Yet this is the penalty that originality must always pay—the penalty of being criticised, the penalty of being called insincere, the penalty of living under the accusation of having borrowed your ideas or having stolen your material.

¶ Shakespeare is accused of having stolen his plays—from whom, the accusers are not able to say; but the fact stands, there has been but one Shakespeare, but one Emerson, but one Confucius—but there have been millions of people to criticise, deride and accuse these men.

¶ If you start out to accomplish some particular thing in life there is always some one on your trail, some one who despises success, some one who envies and despises all good, who can see nothing in other men but that which he finds in himself. A man may spend a lifetime in the formation of character, in formulating the highest principle, in developing the best possible philosophy of life, yet all these things will be regarded as trash by those who are not in sympathy with you and who do not understand.

¶ To some men there is no virtue, no morality, no good, no purpose of high degree, and this is the type of man who sets out to bring all others down to his kind. Start out along a different path to let your natural, healthy desires lead you on to something higher and better, and the pygmies round about you will come to the roadside and attempt to call you back again—to remain a pygmy. They flatter you; they offer you sweetmeats and what not, that they may destroy you, that they may kill your initiative.

¶ If in your persistency you see ahead you are pursued with jeers, mockery and derision. Your "idea is old," your "thoughts are borrowed," your "purpose is not high," you are "not sincere," you do not "practise what you preach," your "thoughts and ideas are stolen from other men"—all the old familiar sayings, the trade accusations of gossipers, scandalmongers and bearers of empty tales.

¶ The fortunate part of it all is that this criticism, this derision, this mockery, this questioning of sincerity of purpose are the things that create strength and form character in the man who is derided and criticised. It teaches him to stand alone, and for this reason is the very source of strength. It assists him in the formation of character; it assists him to extend his wires of originality; it assists him to maintain an independent viewpoint of life; it assists him to understand that law of nature that commands an eagle to tear her nest of young ones from the crags and compel them to rely upon their own strength that they may learn to fly.

¶ And the moral is—If you would do something worth while, if you would give free rein to the divine in you, if you would use your moments and hours to some great purpose, be about your work and be on your way. If you hesitate, there are those who will quickly come to you that they may lull you back to the sleep of indifference. If you go on you will build strength, you will formulate character and find happiness out of the very plans others have made to pull you down.

ABRAM WILBUR MACE

WE are all cogs in a wheel, and it takes some time to find out which cog wears the best." Having said this, W. H. Packer, superintendent of the Carnegie Steel Co. plate mills at Homestead, Pa., turned and walked away. Abram Wilbur Mace, a rolling order clerk, was the cog in particular. At that time he was trying to push his way through the steel mills, and pick up a maximum of information about the manufacture of bars, shapes, plates, etc.

This man Packer was grouchy that morning, because a man who had just learned the making of steel plates from A to Z, made a suggestion that he be transferred to another mill, where he might learn something new. That little platitude about cogs in wheels somewhat stunned Mace, who saw the truth in it when applied to another man; but he hated to tell Packer that his ambitions lay, not in the steel mills, but in the sales offices of the company. So he worked on for another three months.

One day he was in the works office, where he saw the general manager. To him he explained the situation, and for the first time since he entered the mills, he met a man who appreciated his object, and encouraged him. " I get your idea," he said. "Have you seen the sales manager?" Mace replied, "No, not yet." For the present he was bent on increasing his knowledge of steel manufacture, and one day he suddenly packed his trunk and went to the Clairton, Pa., works, where he got a job as foreman in the billet yard.

ABRAM WILBUR MACE.

The day came when the Carnegie Steel Co. wanted men for their warehouse, at Waverly, N.J., to be precise. The idea of doling out steel from warehouses was a new one to the Steel Company then, and the subject of our sketch helped develop the new idea both at Waverly and Boston.

About this time the Factory Products, Limited, of Toronto, approached the Steel Corporation with a proposition for distributing their output in Ontario, and A. W. Mace was sent to Canada. That was in 1911. Factory Products, Limited, started with a small warehouse to supply local trade with small quantities of steel needed quickly. Then a mill business was instituted, and since then success has been phenomenal.

A. W. Mace has just entered his thirties. He was reared in the country, son of a country clergyman. For three years, until he was eighteen, he worked in a general country store in Richmond, Mass. For a while he was assistant postmaster, then he brushed up his mathematics, Latin and Greek, and won a scholarship for the Hotchkiss Preparatory School. In 1902 he passed the entrance for Yale, and in 1906 secured his B.A.

To-day Mace may be seen at his desk in the Nicholls Building on King Street West, Toronto. He is a busy man. If you do see him you will recognize him by his bright, youthful countenance. He was married last February.

Canadian Vickers Limited Shipbuilding Plant at Montreal

"By Maisonneuve"

A perusal of the accompanying article cannot fail to impress the reader with the far-reaching nature of the plans made to establish in our Canadian Metropolis a merchant and naval shipbuilding and marine engineering plant, and while the development towards compassing the achievement aimed at, will of necessity be a matter of years, there is unmistakable indication that climatic and labor difficulties, which meantime have to be combatted, will ultimately be overcome.

AN inspection of the new Canadian Naval Works at Maisonneuve on the Banks of the St. Lawrence at Montreal presents to the eye an instructive spectacle and to the mind subject for inspiring reflection. We have time and again been asked to believe, against our better judgment, that the building of warships in Canada is an economical, if not physical, impossibility. The works, which are developing into material form, contradict all such prognostications, and reflection on the significance of the addition of such an establishment to Canadian resources opens up a vista of potentialities too vast to be accurately measured.

FIG. 3. GROUND PLAN OF CANADIAN VICKERS SHIPBUILDING WORKS AT MONTREAL.

Stability of the Enterprise.

The project materializing is not the conception of an inexperienced speculative mind, but is the embodiment of great and ripe experience. In their estimate of the possibilities of the project, in the arrangement and equipment of the works, and in the design, construction and completion for service of ships to be built in the establishment, the projectors have the operation and technical assistance of the greatest naval firm in Great Britain that of Vickers Limited.

In the past five or six years, the Vickers Company have been responsible for the construction of thirteen of the world's largest ''Dreadnoughts''—apart altogether from their contributions in armour, ordnance and propelling machinery for other battleships—and of a great variety of smaller warships. Their support and guarantee of the immense establishment now being created on the St. Lawrence must, therefore, rule out of court all predictions as to the difficulty of achieving complete success in the building of warships and merchantmen in the Dominion.

The Economic Feature.

The conditions in Canada, are no more severe than, for instance, those obtaining in Russia, where for years satisfactory work has been done. As regards industrial economics, again Canada is not worse off, and perhaps we are better off than our neighbors, the United States, where the enormous advances made in the development of mechanical appliances for economizing labor have robbed the bugbear of ''high rate of wage'' of much of its significance.

It is more and more being recognized that a high rate of wage may become an advantage from the economical point of view, because it so greatly stimulates improvement in mechanical appliances. Therefore, the fact that in the equipment of the new works at Montreal, the experience of such a firm as Vickers will be available in determining the character and design of all machinery to facilitate production, justifies full hope that the results will be eminently satisfactory from this standpoint.

The Canadian Navy Feature.

There is no question that before many years have passed, Canada will produce warships as well as commercial ships, equal to those of any other nation, to take their place in the fleets of the world, and to give as good a report of themselves as the ships of the oldest and most prosperous of commercial countries. All in the Dominion recognize the need for defence. Most of us are convinced too, that Canadian ships should ever be at the call of the Homeland in her hour of need, while no one will fail to agree to assist in the maintenance of the Imperial Navy.

There is, at the same time, however, a great and justifiable ambition to create an industry in Canada for the building of war and merchant ships, and to place such an industry upon a sound commercial basis. The question, therefore, arises as to whether these two ideas should not be brought into close relationship with each other, so that, at no far distant date, Canada may be able to take her share in the building of the Imperial Navy. Thus, whilst spending money on the navy there would, at the same time, be fostered and perfected commercially a great industry, which would be an abiding advantage to the nation.

To realize the benefit of such procedure, one has only to reflect upon the enormous gain to the resources of the Mother Country of the privately owned warship building establishments, which have grown up within the present generation by reason of the patronage of the British Admiralty. These naval establishments are to-day a great source of wealth to the Mother Country, not only because of the warships built for His Majesty's Navy, but also because of the many vessels constructed for foreign fleets.

The guarantors of the Montreal Naval Works hold such a place in the naval construction history of the world, that every confidence may be reposed in them, and the belief accepted that the money which may thus be spent on the banks of the St. Lawrence will give as economical results as the same money spent in the Homeland.

Development of Auxiliary Industries.

The full possibilities of the situation are not, however, measured alone by the building up of the shipbuilding industry in Canada. There are many incidental industries, which will be nurtured by the establishment of shipbuilding. These are almost innumerable, and of such a nature as would in the end enable Canadian labor largely to supply Canadian demands, apart altogether from the necessities of the maritime trades. This is a point which cannot be too forcibly urged. Statesmen recognize that no Nation can become truly wealthy which depends exclusively on natural products, whether they be agricultural or mineral. The Americans, like the nations of the Eastern hemisphere, have fully grasped this economic law, and the aim in Canada ought to be to protect and cultivate those manufacturing industries which yield a greater degree of wealth than the products of the soil, as a supplement and support to the latter.

Decadence of Canadian Shipping.

Has Canada in recent years advanced sufficiently along the line of greatest possibility in this respect? If the case of the maritime trades alone be considered, it is unsatisfactory to discover how small a part is played by Canadian owned ships. Ere yet steam displaced the "unbought wind" in the propulsion of ships, and before steel supplanted timber as the constructive material for vessels, Canadian ships played a prominent part in the transport of goods, the tonnage even as late as 1883 being nearly double that of the vessels owned to-day. In five years, there has been only an increase of 9,000 tons in the tonnage of the shipping registered in Canada, so that there is a call for the building up of a bigger Canadian merchant fleet worthy of the Dominion.

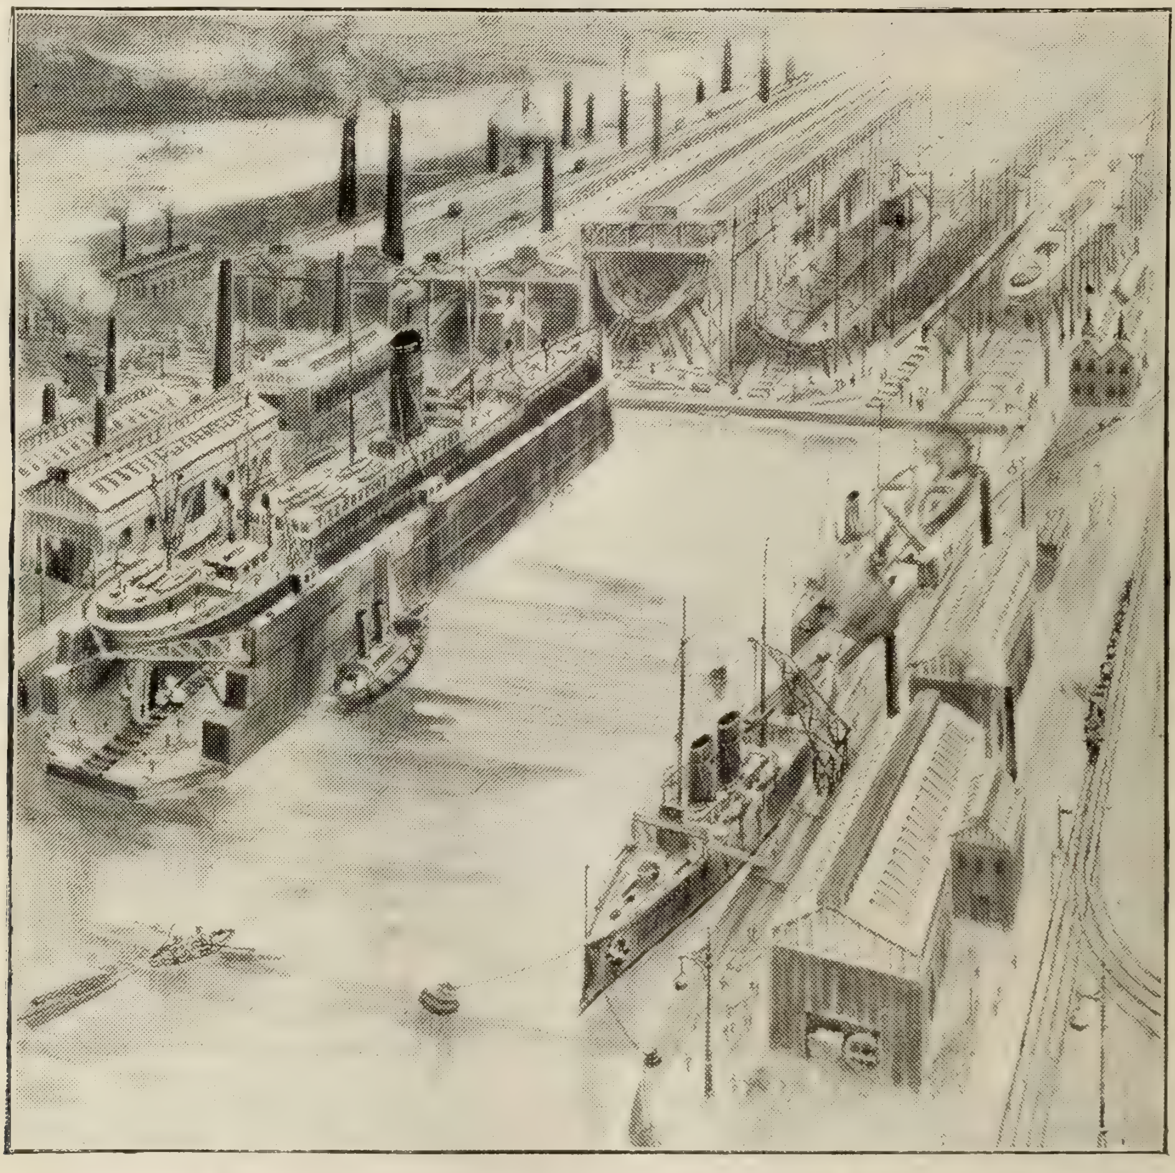

FIG. 4. BIRD'S-EYE VIEW OF CANADIAN VICKERS' SHIPBUILDING WORKS AS THEY WILL APPEAR WHEN COMPLETED.

Similarly in the metal industries, there is room for great expansion. The steel bounties, which date only from nine years ago, have had the effect of considerably increasing the making of steel, but further stimulating influences are required. This, an important phase of the question should have full consideration in settling the ultimate policy of our statesmen in regard to our participation in naval defence and the assistance we should render to the Imperial Forces. Shipbuilding works established on the western seaboard, as well as on the eastern, while creating a new industry of far-reaching importance and stimulating other branches of mechanical activity, would give employment to vast bodies of workers, provide means of overhauling and repairing the ships required for naval defence, develop the owning and building of merchant shipping, and generally increase the wealth of the Dominion.

Montreal's Floating Drydock.

Already the Battleship-Floating Dock associated with the new establishment at Montreal, and appropriately named "The Duke of Connaught" by Royal permission, has done splendid work. Of its capacity, there is no need to write at length, in view of the fact that some of the largest ships trading on the St. Lawrence have already been berthed upon it and have undergone extensive repair. The largest of warships can easily be accommodated because the width between the walls is 100 feet and there is practically no limit to the length of vessels which may be dealt with. Moreover, by characteristic prescience, the management decided to have a dock, which could be separated lengthwise, into three complete parts, so that one or two or all of the sections may be utilized according to the size of the ship to be docked. Thus, it is possible to dock independently and simultaneously three of the vessels engaged in the internal navigation of the Dominion.

Fig. 1 shows the "Montreal," a typical Canadian vessel entering two sections of the dock, which have been sunk by the admission of water into the double bottoms, while the third section is seen separately awaiting another ship.

Fig. 2 shows the "Lake Manitoba," one of the largest of the C. P. R. ocean fleet, undergoing repair within the dock. The "Lake Manitoba" has a length of 470 feet, a beam of 56¼ feet, and a tonnage of 9,674 tons.

Plant Extent and Equipment.

The establishment at Montreal as it appears to-day covers about 45 acres. Men are now busy completing the ship fitting-out basin—12 acres in extent—in which is accommodated the floating dock; the depth of water being 50 feet. The foundations are being put in for the berths at the head of this basin for the construction of ships of the largest size, and these will be launched into the basin. Buildings are being erected to accommodate complete installations of machine tools for the construction of ships, engines, boilers and all marine auxiliaries. There are also being formed now the concrete foundations, on which the heavy machine tools will be placed.

In the basin, and in the channel forming the exit into the St. Lawrence, there are at work several of the dredges of the Montreal Harbor Commission and of the Government Department, both of whom have heartily seconded the efforts of the promoters towards the realization of this scheme of first-class national importance. Only a few months ago, the site now marked out by the basin walls and the foundations for the machine shops was a small creek or was bedded in the foreshore of the St. Lawrence, much of the land having been reclaimed from the river which is here a mile wide.

Ship Fitting-Out Arrangements.

Fig. 3, and the bird's eye view Fig. 4, show the works as they will appear when completed. A prominent feature is the ship fitting-out basin formed by two concrete walls almost parallel with the St. Lawrence. At the head of this basin are the shipbuilding berths, now being constructed. These are to be entirely covered in, and are being arranged to take vessels up to 1,000 feet in length, and of proportionate beam. The advantage of covering in the berths is that work may proceed under all weather conditions. The crane arrangement, too, will be such that considerable

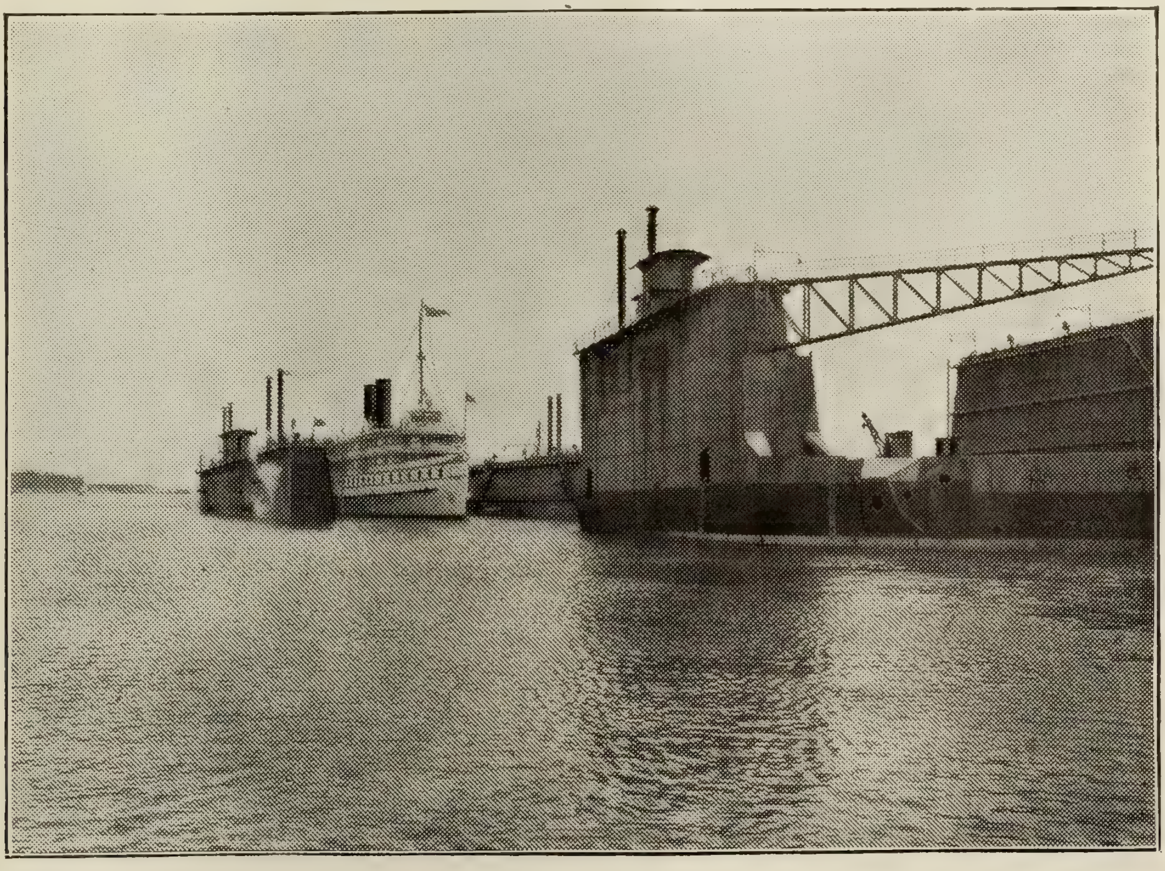

FIG. 1. R. & O. RIVER STEAMSHIP "MONTREAL" ENTERING TWO SECTIONS OF THE FLOATING DRYDOCK.

weights can be lifted on board, prior to the launch.

As is well known, some new ships built in the Old Country are launched merely as shells with the minimum of work upon them, while others are in a much more advanced condition, all the boilers and many of the auxiliary engines being fitted on board. The provisions made in the Montreal establishment will enable either the minimum or maximum of work to be done before the vessel is floated, so that the actual date of launching the ship may be advanced or retarded to suit conditions without interfering with the pre-arranged date of completion.

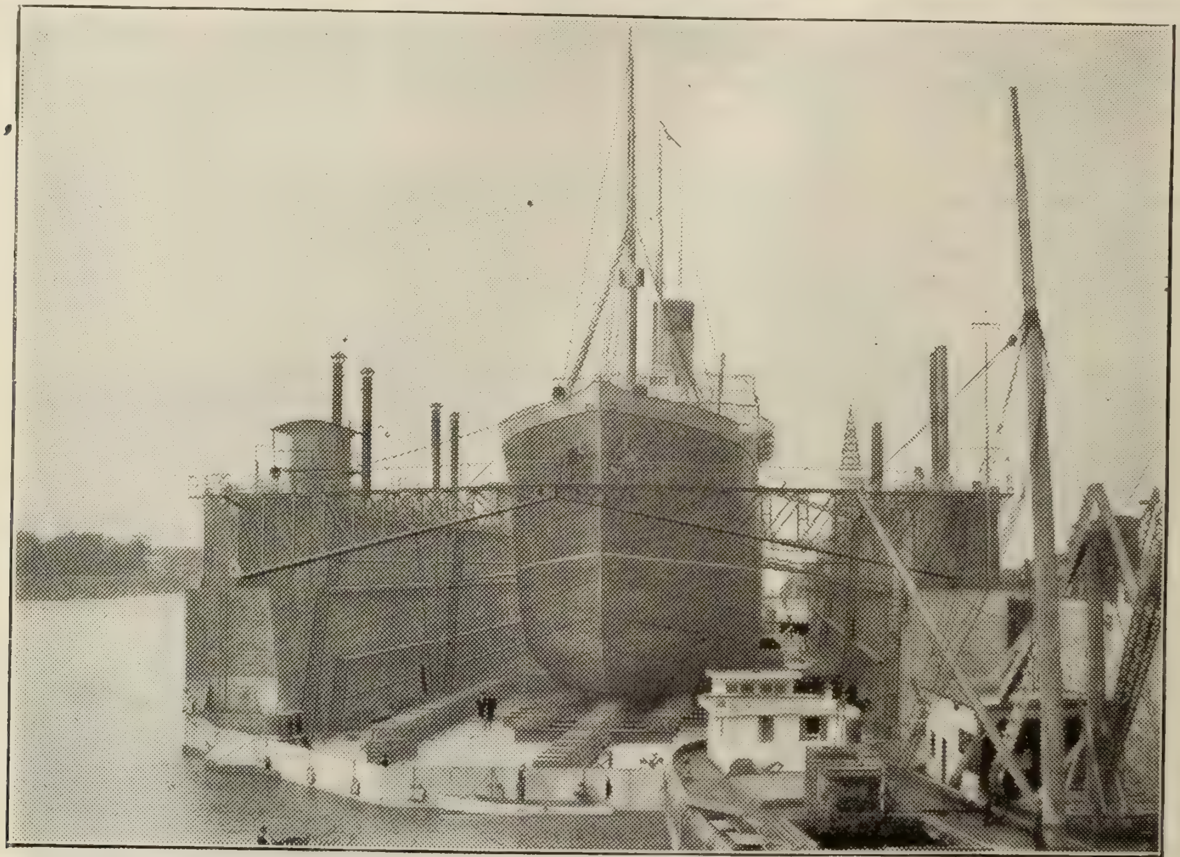

FIG. 2. C.P.R. ATLANTIC STEAMSHIP "LAKE MANITOBA" UNDERGOING REPAIRS IN FLOATING DRYDOCK.

Ship Construction Equipment.

The buildings for the accommodation of the ship construction machinery are being erected between the building berths and the river, while those for the construction of the propelling engines and boilers are on the landward side of the building berths. The construction of these buildings is in progress, and they are of the latest design approved in the shipbuilding world. The equipment of machine tools will be as complete as in any British yard, and each will be supplied by the best maker of its respective types.

All the machines will be independently driven by electric motors, and each of the largest will have a crane fitted for the manipulation of plates and angles. Plates up to 40 feet in length, 8 feet in width and 2 inches in thickness are being provided for in the machine capacity. There is being built an independent department for dealing with angles and beams, and, as in the plater's shed, the furnaces will be operated by gas generated in producers and conveyed to the furnaces, as well as to the black-

BE ENTIRELY UNDER COVER, THUS ENABLING WORK TO BE CARRIED ON IN ALL WEATHERS. E. G. M. CAPE IS THE GENERAL

smith's fires, in underground conduits.

The blacksmith's shop will contain several steam hammers, each equipped with an electric crane. There will also be in this department a large forge, having alongside a separate furnace. An annealing furnace will also be installed.

Ship Equipment Production.

Independent buildings are being erected for the accommodation of plumbers, sheet iron workers, copper-smiths, wire-workers, tinsmiths, electricians, and other tradesmen, the aim being to carry out practically all work in connection with the building of all types of ships. The joiners, carpenters and others connected with wood work are to be accommodated in a separate building of two stories. On the ground floor, there will be a comprehensive collection of the latest design of machinery and, according to the best practice, all these machines will be driven by electrical motors placed under the floor level. The upper floor will be for hand work only.

Accommodation is also being provided in the same building for the moulding of the ship's frames, etc. There are also riggers' and sail-makers' lofts, having, as in all departments, complete mechanical appliances for ensuring the greatest volume of production for a given amount of labor and supervision.

Propelling Machinery Production.

The building for the construction of propelling machinery will be as complete as any yet devised in any country. The machinery will be designed and built according to the latest experience for the manufacture and repair of all classes of marine and other engines, including steam reciprocating and turbine machinery, oil engines, such as may be fitted to sub-marine as well as surface craft and all auxiliaries connected with ships. In the engine erecting shop which is of specially large ground area there will be installed overhead cranes to lift loads ranging up to practically 100 tons.

Some idea of the magnitude of the work which it is proposed to undertake may be formed from the size of some of the more notable tools. There will be a horizontal machine capable of boring 12 feet diameter by 35 feet long; a lathe capable of taking a turbine 40 feet long; an 8 ft. chuck lathe with two compound slide rests; lathes for shafts up to 24 in. diameter, and 80 ft. long; in addition to correspondingly large milling, shaping, slotting and wheel-cutting machines, saws, grinders, etc. These and other machines will be utilized for the manufacture of guns. There will also be a complete installation of small machine tools for brass finishing and light work, etc.

Boiler Shop and Foundry.

In the boiler shop, which is to be a continuation of the engine factory, of the same dimensions, and equipped with equally powerful cranes, there will be every tool which extensive experience has shown to be efficient for the construction of all types of boilers.

Large foundries for iron, steel and brass, are being arranged, so that the

CANADIAN PACIFIC S. S. "MOUNT TEMPLE" IN FLOATING DRYDOCK "DUKE OF CONNAUGHT," IN MONTREAL, OCTOBER 9, 1913.

FITTING OUT BASIN

NEUVE, MONTREAL. MOST OF THE LAND COMPRISING THE SITE CONSISTS OF MADE GROUND, SOME OF IT BEING SPOIL
WITH ABOUT 2,000 McARTHUR CONCRETE PILES, 16 INCHES IN DIAMETER BY 30 FEET LONG. THE SHIPBUILDING SLIPS WILL
CONTRACTOR, THE PILING CONTRACT HAVING BEEN SUB-LET TO THE McARTHUR CONCRETE PILING CO., NEW YORK.

firm will be able to produce their own castings, and make it, in this respect, independent of outside sources for these.

All machine tools in all departments will be electrically driven. The electric power will be taken from one of the local supply Power Companies of Montreal at a pressure of 10,000 volts, and in the plant there will be a central station with three large rotary converters for transforming the current to suit the operation of the various machines, and for lighting the works. An hydraulic accumulator actuated by electrically driven pumps to give a working pressure of 1,500 lbs. per square inch will also be installed, while in connection with the working of pneumatic tools, there will be two air compressors.

Test House and Laboratory.

Every precaution is being taken to maintain as high a reputation in the Dominion as Vickers have achieved in Britain, and for this purpose, there is to be included a well equipped test house and laboratory, containing all the latest appliances. In this department, there will be tested all construction materials, in order to eliminate as far as is possible all defects. It may be added that in arranging the plan of the works, provision has been made so that each building can be extended, and new shops laid down without interfering with the general scheme.

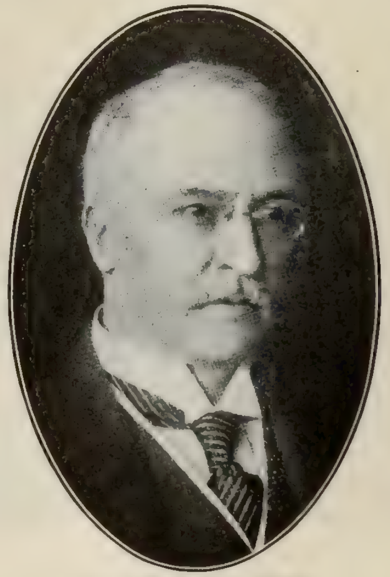
From first to last, the establishment, promises to be as satisfactory and complete for the building of all types of ships for the Navy and Merchant Service as any in the world, and from this point of view the advent of the Canadian Vickers Ltd. on the St. Lawrence will, as already indicated, open up great possibilities for future developments, particularly as there will be brought to bear in this connection, not only full guarantees for success, but the professional ability, experience and resource of a firm unexcelled in this particular department of applied science.

◆

S.S. "MOUNT TEMPLE" REPAIR.

ONE of the biggest jobs so far undertaken by the Canadian Vickers Company was that involving the repair of the C.P.R. liner Mount Temple. This vessel left Montreal for Antwerp at dawn on September 24th last, with a grain cargo of 120,000 bushels. When opposite Longueuil, she got out of her course and ran aground on a mud bank, doing considerable damage to her bottom. Attempts were promptly made by tugs to pull her off, but without avail, and the vessel remained aground until September 26th, by which time sufficient of her cargo had been discharged into lighters to enable her to be floated. She then returned to her berth under her own steam, and at once commenced to discharge the balance of her cargo of grain. This proved a tedious business, owing to the lack of mechanical unloaders constructed to enter a hold as deep as that of the Mount Temple, consequently it was not until Sunday, October 5, that the vessel was towed down to Maisonneuve to enter the "Duke of Connaught" floating dry dock. She entered the dock at 12.50 p.m. and was centred by 1.10 p.m.; the powerful pumps of the dock being started at 1.15 p.m. Fifteen minutes later the liner's keel touched the blocks and by 3.45 p.m. the dock was dry.

An examination was at once made and revealed the fact that the liner had sustained considerable damage. Several plates forward and some amidships had been dented and pierced, and from the gaping seams, stones, some of which were nearly as large as a man's head, were pulled out, showing that when the ship struck the mudbank, or, as her officers claim, before she did so, she struck something very much harder than mere mud.



DR. RUDOLPH DIESEL.

The Canadian Vickers Co. put every available man to work carrying out the repairs as soon as the official survey of the ship's injuries had been made by Captain Reid, port warden. Work was carried on day and night, and by Friday night, October 10, the damage had been made good. However, the Mount Temple was not undocked until mid-day on Sunday, October 12, owing, it is understood, to the company having been requested to carry out some further work on the hull which it was considered advisable to attend to while a good opportunity offered. The repairs effected were of such a nature as to enable the vessel to cross the Atlantic with a full cargo, and, on leaving the dock, she at once returned to her berth and commenced loading up again with grain and deals.

The fact that the Canadian Vickers Co. were able to handle this job, even though their plant is as yet far from being completed, has caused great satisfaction in shipping circles and amongst business men generally, the important part which this large firm is destined to play in the marine development of the Dominion being fully realized and appreciated.

◆

DR RUDOLPH DIESEL.

DR. RUDOLPH DIESEL, whose disappearance was chronicled recently, was born in Paris in 1858, and although of German parentage, commenced his education in France. At the age of 13, he was sent to Augsburg and later to Munich. After serving for some time as assistant to Prof. von Linde, he spent a short time in practical work in Winterthur with Sulzer Bros., and was afterwards appointed Manager of the Paris firm for the manufacture of the Von Linde refrigerating machinery.

Ever since his early days at Augsburg and Munich, his main ambition, possibly an obsession, was to discover a prime mover with a much higher thermal efficiency than the steam engine. He designed an engine, and, in 1893, Messrs. Krupp and the Augsburg-Nuremberg Co. gave him financial assistance for its construction on the lines he had designed. This was a failure, indeed it exploded and nearly killed Dr. Diesel, but it showed at any rate that pure air could be compressed to such a degree that it would ignite oil fuel. A second engine was more of a success, but was not reliable, and was, moreover, attended with much danger in the working, but after several experiments with it, another was constructed by the Augsburg Company in 1897, and this proved to be successful.

Since then, many improvements have been effected. The first Diesel engine installed in a ship was built in 1903 by Adrien Bochet and Frederic Dyckhoff, this being of 20 h.p. and having two pistons working in opposite directions in one cylinder on the 4-stroke cycle. The patents for Great Britain are owned by the Diesel Engine Co., which is now merged into the Consolidated Engine Manufacturers, Ltd.

The circumstances of the tragic disappearance of this great inventor are too well known to be reiterated, but if it be true that he is lost to us for ever—and we are reluctantly compelled to admit the great probability—the world has been deprived of a great inventor whose perseverance and tenacity of purpose won for him the admiration of all who know the story of his early failures.—S. & S. Record.

Steam Boiler Explosion at City Gas Plant, Oshawa, Ont.

Some time ago we were asked why we did not publish editorial matter dealing with boiler explosions in Canada, and, in reply, had to make confession that it was entirely on account of the paucity of such occurrences. An opportunity is now afforded us, yet we trust that the explosion interval may continue to expand, thereby adding fresh laurels to our manufacturing ability, our operative care, and our inspection thoroughness.

ON Friday morning, September 12th, there occurred a disastrous boiler explosion in the plant of the City Gas Company, Oshawa, Ont., from which two men lost their lives, and considerable damage was done to the gas plant and buildings generally.

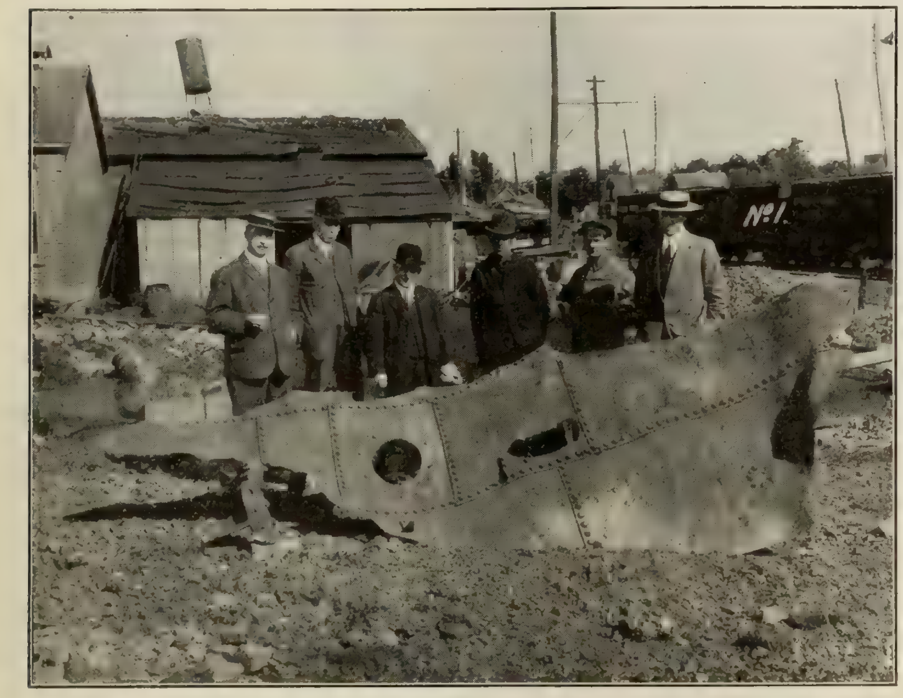


FIG. 1. TOP HALF OF BOILER SHELL BLOWN A DISTANCE OF 350 FEET.

The boiler referred to was of the return tubular type, 44 in. dia. by 11 ft. 6 in. long, and contained 40 3 in. tubes. The shell was made up of three courses of ¼ in. plate. The centre course consisted of four pieces, as seen from the photos, and the heads were 5-16 in. thick. The circumferential and longitudinal seams were lap and single riveted, using ⅝ in. rivets pitched 2 in. centres. Each head was braced by 3 diagonal stays made of iron and welded.

The stays were attached to the heads by double crow feet 3 in. x ½ in., and were secured to the head by 4 ⅝ in. rivets. The palm of stays, 2 in. x ½ in., were secured to shell by 2 ⅝ in. rivets.

The boiler was supported on brickwork by two cast iron brackets on each side, which were attached to shell by 6 ⅝ in. cap screws, with nuts on the inside. The front head of boiler was made up of four pieces, as seen from the photos.

The dome was 21 in. dia., 31 in. high, and the head was secured to sides by 3 ¾ in. stays. The neutral part under dome was cut away the full size of the latter.

History and Characteristics.

As to the history and characteristics of the exploded boiler, investigation went to show that it was forty years old, and had been in service in the gas plant about six years, being a second-hand boiler when installed. An examination of the exploded boiler showed cracks in many places. The plates were torn, and the joint left intact. The plates were badly laminated and crystallized, and, in fact, appeared to be completely worn out.

Coroner's Jury Finding.

(1)—That the deceased came to their death, caused by an explosion of a steam boiler, on September 12th, 1913, while at work on the premises and in the employ of the Oshawa City Gas Co., in Oshawa, Ont.

(2)—We are unable to say what caused the explosion, but from the evidence it appears that the water in the boiler was allowed to get too low at times, and that the boiler was subjected to extreme pressure.

(3)—We also believe that the man in charge had insufficient experience in the care of steam boilers.

(4)—We also believe there should be a better system of boiler inspection by thoroughly competent Government inspectors for all stationary boilers under the management of competent men when human life is at stake.

(5)—We also find from the evidence produced that the boiler, in our judgment, was old, unsafe, and unfit for the

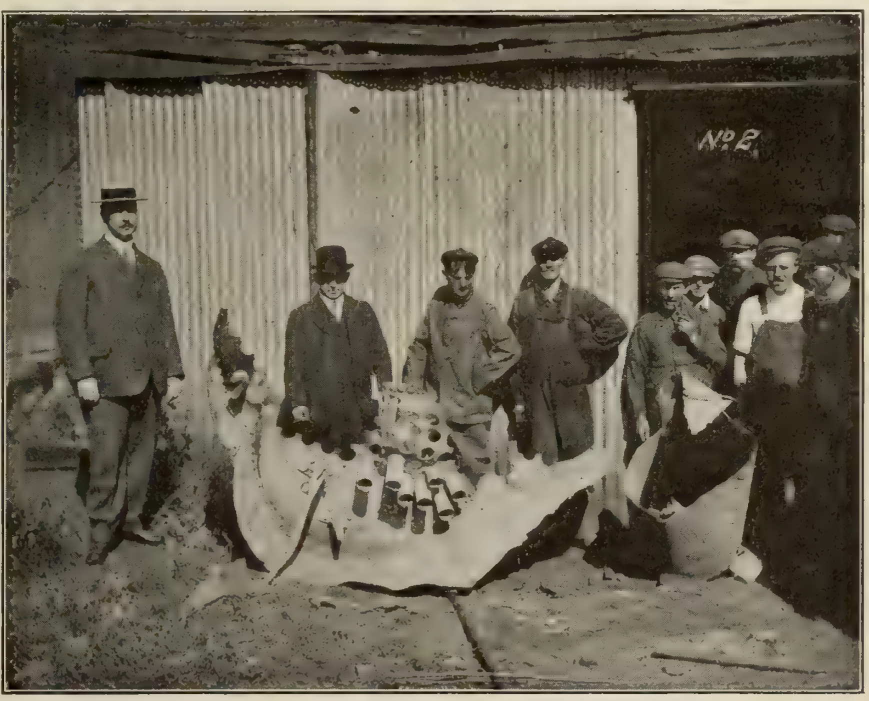

FIG. 2. REAR HEAD AND DOME OF EXPLODED BOILER.

pressure and work for which it was employed.

Photo No. 1 shows the top half of shell, which was blown over the building and landed about 350 feet away. Note the elongated hole in sheet where the lug was blown out, also the number of pieces in centre course in shell. The lug blown out can be seen on ground in front of shell plates. The man standing to the left is D. M. Medcalf, Chief Inspector of Steam Boilers for the Province of Ontario, while the third man from left is T. J. Main, one of the Provincial Inspectors.

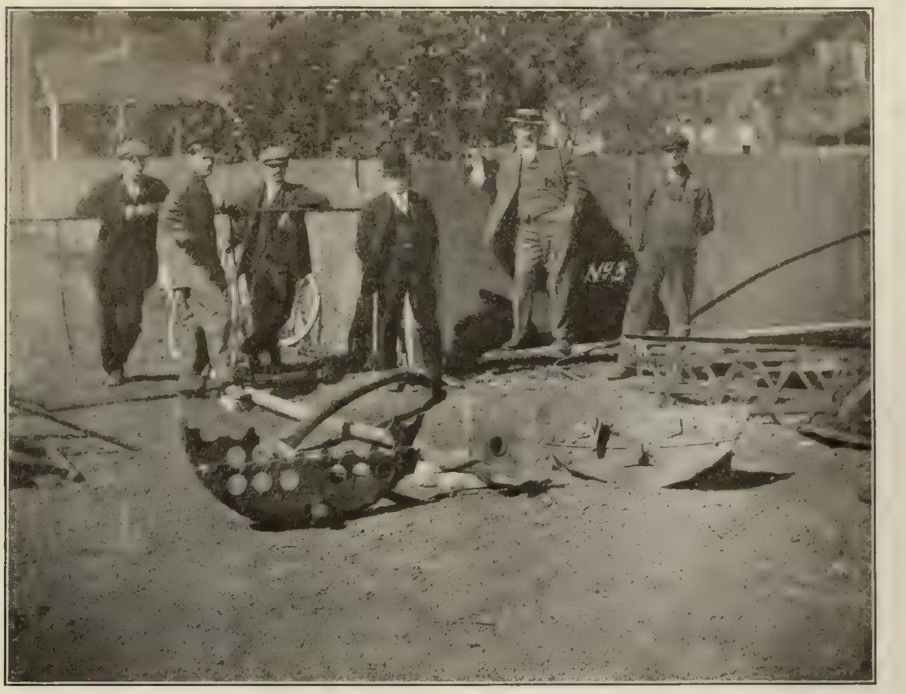

FIG. 3. FRONT HEAD OF EXPLODED BOILER.

Photo No. 2 shows the rear head and dome of exploded boiler. Note the tubes ends in tube sheet, where they separated at the welds.

Photo No. 3 shows the front head. Note the repairs that had been made, and the manner in which the head had been blown to pieces.

Photo No. 4 shows the inside of the plates over the fire. Note the cracks on longitudinal seams.

* * *

BOILER BAGGING.

THE majority of the reported cases of boiler bagging are due to the presence of scale or oil in the boiler, states a writer in the "Power User." The removal of the former may be accomplished by what has been termed the "periodically clean" method—that is to say, by the use of mechanical cleaning methods each time the boiler is opened up for inspection, by the introduction of boiler compounds, or by treating the feed water chemically.

No amount of chemical treatment will remove oil from feed water, however, and some mechanical filtering process must be relied upon for its elimination. Some engineers favour cloth filters and some sawdust, sand or other substances; but most depends upon the design of the filter itself, and individual manufacturers of these apparatus may be relied upon to adopt the filtering medium which is best suited to their own construction.

With regard to the comparative harmful properties of various oils, the most dangerous bags and blisters are generally caused by animal and vegetable compounds, with or without the additional presence of scale. Attempts to boil them out with soda or some alkali are to be severely condemned as rendering the oils more dangerous still.

SCOWS FOR QUEBEC HARBOR COMMISSION.

THE Quebec Harbor Commission are having built at the Polson Iron Works, Toronto, six steel dump scows; three with a capacity of 500 cubic yards, and three with a capacity of 300 cubic yards. They will be built entirely of steel, with square bilges; the hull plating being connected by steel castings. The overall dimensions of the 500 yard scows are 144 feet long by 31 feet wide by 11 ft. 6 inches in depth. The 300 yards scows are 108 feet long by 28 feet wide by 11 feet deep.

The hoppers are divided into pockets, and the sides have water-tight compartments formed by transverse bulkheads. In the 500 yard scows, the hoppers are divided into 7 pockets, each being 16 ft. long by 9 ft. 3 in. deep by 21 ft. wide at the deck. They have, on each side, 9 w.t. compartments with 7 bulkheads. The 300 yard scows have 5 pockets, each 16 ft. long by 8 ft. 6 in. deep by 19 ft. wide at deck. They have on each side 7 w.t. compartments with 5 bulkheads. In all cases the depth from pocket combing to deck is 2 feet with a deck chamber of 6 inches. In the 500 yard scows the discharge doors in each pocket are operated by a steam driven worm gear, while the 300 yard scows are equipped with a hand operated worm gear.

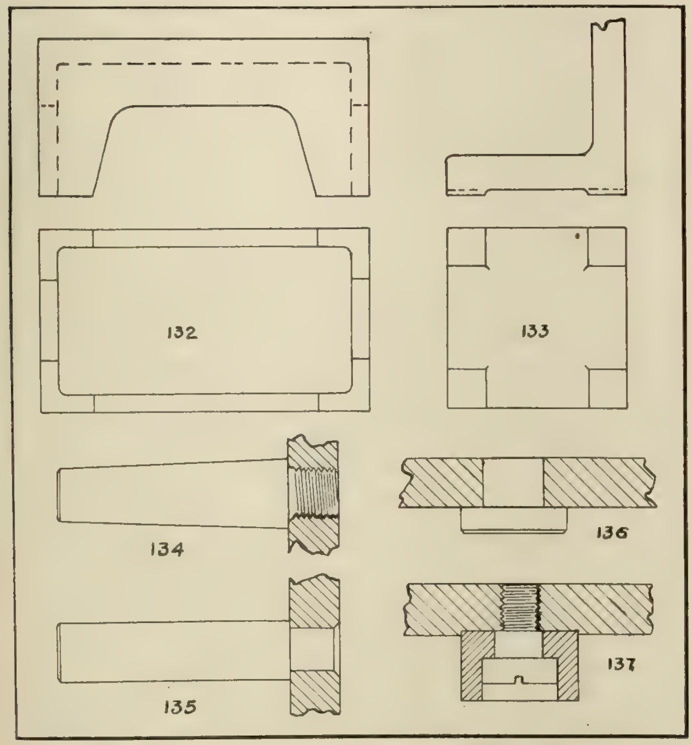
Drill Jig and Fixture Design and Construction

By H. R.

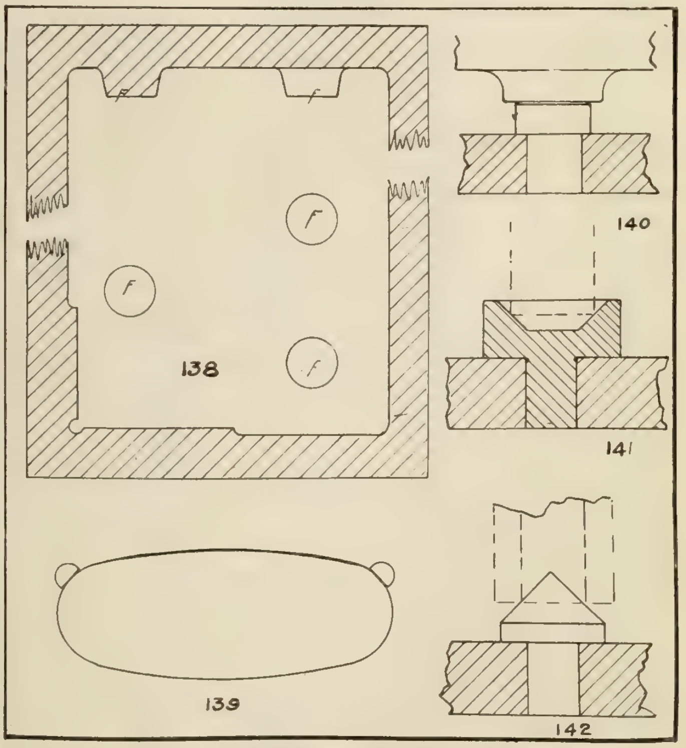
The sketches and data will, the writer hopes, appeal to machine shop superintendents, designers, toolmakers, and novices, as indicating the large place jigs of every kind and for every service occupy to-day in machine shop practice.

IN all cases drill jigs should be provided with legs or feet on the sides opposite the bushings, or some other means provided of squaring up the jig on the table of the machine so that it will be vertical with the tools. The manufacture of the jig is also greatly facilitated by the addition of these feet, as it is much easier to lay out and plane the surfaces. Where no feet are required, it is a great advantage to the tool maker to have small lugs cast on to the sides of a jig when it is of cast iron; they provide good bearing surfaces when laying out for machining. It is usual to provide jigs with four feet, but in some cases it is sufficient to have only three. Care should be taken that in each case all the bushings and places where pressure will be applied are placed inside of the geometrical figure. This is obtained by connecting with lines the points of location for the feet.

While it may seem that three feet will be sufficient, it being obvious that the jig will obtain a bearing on all of them, it is hardly safe to use only three supports, because chips are liable to get under the feet and throw the jig out of line without being noticed by the operator. If the same thing happen to a jig with four feet, it will rock about and the operator will at once detect the trouble. Again, if the table is out of truth, this will also be noticed at once.



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.

There are several ways of making jig feet, the most common being to cast them solid with the jig in the case of cast jigs, while for built up jigs, the legs are generally screwed into the piece. These are illustrated by Fig. 132, which depicts the feet cast on.

Fig. 133 shows facing pieces, which act as feet as well as points for marking off, etc., in the manufacture of the jig.

Fig. 134 shows legs that are turned off from the bar and screwed up to a shoulder.

Fig. 135 illustrates a type that are riveted into the jig. The legs are usually made of cold rolled steel hardened and ground on the bottom so that all the legs or feet are the same length.

Fig. 136 shows what is termed an inserted pin. A stock of these is usually kept so that they can be used for locating or supporting work as well as acting as feet.

Fig. 137 shows another good idea for jig feet, which will save machining strips and can be fitted as the toolmaker thinks best. These can be also carried in stock to advantage.

There are many ways of locating a piece in a jig. This is usually accomplished by means of finished pads cast on the jig, bosses, seats, lugs, etc. An idea of these may be gathered by the illustration, Fig. 138. In this the locating points are marked (F). These bring the piece to be operated upon in the right relation with the bushings for the drills, or to the gauges to which the other tools may have to be set. This method of location is very satisfactory when the work is finished in a uniform way, also when the variation in the components is very slight.

Another way of locating work is by dowel pins, as shown in Fig. 139. The sides of the pins which locate the pieces are usually flattened by a file, and adjusted to suit the pieces to be machined. This procedure also prevents too rapid wear on the locating pins, as would be the case if the work bears against the pins along a line only.

Very often pins and studs are inserted in jigs to act as locating points instead of having lugs cast directly on the jig, as shown in Fig. 138. A case where a pin is used for this purpose is shown in Fig. 140, where the body of the jig has the pin inserted to act as a locating and resting point, and the work located against the face of the pin. Locating pins of this type should always be provided with a collar or shoulder, to take all the pressure of the work they support, without any possibility of moving in the hole into which they are inserted.

When it is essential that a cylindrical part of the work be located centrally either with the outside of a cylindrical surface or with the centre of a hole passing through the work, good locating designs are provided by Figs. 141 and 142. In Fig. 141 the inside conical locating piece is of cold rolled steel, and may serve as a drill bushing, as shown in a former article.

Fig 142 shows a stud turned conically so as to enter the hole of the work. These two locating pieces are always made stationary and are only used for locating the work and not for binding purposes or clamping.

SEPTEMBER FIRE LOSSES.

THE fire loss of the United States and Canada for September, 1913, as compiled by the New York Journal of Commerce, shows a total of $17,919,300. These figures show an increase of more than $4,000,000 over the record for September of last year and $6,500,000 over the same month of 1911.

The following table gives a comparison of the losses by fire during the first nine months of this year, together with the same time in 1912 and 1911, also the losses by months for the balance of those years:—

	1912.	1913.
January	$35,653,150	$20,193,250
February	28,601,650	22,084,600
March	16,650,850	17,511,000
April	16,349,400	16,738,250
May	21,013,950	17,225,850
June	16,103,450	24,942,700
July	15,219,100	20,060,900
August	14,158,800	21,180,700
September	13,779,300	17,919,300
Total 9 mos.	$177,429,650	$178,456,550

BIG INCREASE IN CANADIAN EXPORTS.

A STRIKING feature in the Statement of the Trade of Canada for the month of September, issued by Hon. J. D. Reid, Minister of Customs, on October 23, is the decrease of imports and the increase of exports.

Dutiable goods to the value of $37,997,000 and free goods to the amount of $16,342,000 were imported during September last. The imports for the corresponding month of 1912 were $38,548,000 dutiable goods, and $19,307,000 of free goods.

Exports for last September were $37,048,000 of domestic goods and $4,071,000 of foreign goods, as against $25,814,000 domestic and $3,153,000 foreign for September, 1912.

The total exports for the six months ending September 30th last were, all of domestic goods, $188,405,000, and foreign goods, $22,842,000, as against $162,427,000 of domestic and $15,972,000 foreign for the six months ending September 30th, 1912.

The exports of agricultural produce show a big increase, being $11,829,000 for September, 1913, compared with $5,575,000 for September, 1912. There are big increases in exports all along the line. Exports of minerals for September last were $6,402,000, and for the previous September, $5,278,000. Exports of manufactures also show an increase, being $5,041,000 for September, 1913, as against $3,587,000 for September, 1912.

Canadian trade was never in a more prosperous condition, as the total Canadian trade for September last was close upon one hundred millions, the actual figures being $95,665,000, compared with $87,606,000 for September, 1912. For the first six months of the present fiscal year ending September 30th last, the total Canadian trade was $551,978,000, compared with $506,265,000 for the corresponding six months of the fiscal year 1912.

TO PREVENT ACCIDENTS.

DON'T use tools or appliances, nor touch machinery or belts, until you have been fully instructed as to their proper use and care.

Don't move a locomotive without being authorized by your foreman, or his representative, and ringing the bell before starting.

Don't walk through escaping steam; go around it.

Don't walk in front of wheels when rolling them unmounted, and when pushing mounted wheels, push at centre of axle and not on rim.

Don't go under a car on jacks unless car is trestled or blocked.

Don't use jacks until you know they are properly set, or start to jack a car up before securing the truck at the other end.

Don't stand near a cable or chain when a heavy pull is being made.

Don't wear gloves or loose clothes when working with machinery or tools.

Don't use tools in bad order.

Don't touch dynamos, generators, switchboards or other electric appliances, or wires connected therewith, before being fully instructed as to their use.

Don't touch the third rail with person or tools. If necessary to remove an object therefrom, use a dry wooden stick.

Don't handle broken power wires without proper protection.

Don't use water, but sand or dry earth to smother electrical flames.

Don't stand with your hands behind your back, with your back towards generator or switchboard.

Don't connect or disconnect bus line jumper cables between electric cars when all cars in the train, or draft, are not either in contact with or entirely disconnected from the third rail or trolley, without first opening the compressor, lighting and heating switches on cars not making contact.—Southern Machinery.

TRADE WITH BRITAIN.

THE following are the official figures of the trade between Canada and Great Britain during September:—

From Canada.	1913.	1912.
Wheat	£6,065,423	£6,322,109
Oats	624,558	558,879
Maize	64,773	17,773
Cattle	36,212	140,315
Bacon	689,207	947,569
Hams	280,778	181,614
Butter	4,522	134
Cheese	2,656,571	2,967,386
Canned Salmon	600,586	633,990
To Canada—		
Spirits	510,460	515,988
Sugar	36,445	115,831
Iron ore	2,699	9,102
Wool	79,165	93,862
Pig iron	118,652	165,334
Rails	3,784	11,822
Ship, etc., plates	33,869	19,087
Galvanized sheets	400,162	252,697
Pig lead	103,717	184,058
Unwrought tin	134,038	149,942

RAPID BLAST FURNACE RELINING.

THE No. 3 blast furnace of the Algoma Steel Corporation, Sault Ste. Marie, Canada, was blown out for relining at 2.45 a.m. September 14, 1913. The top of the furnace was removed to be remodeled while the old lining was being taken out. The brick work was started at 9 a.m., September 21, and completed at 4 a.m., October 4. The time drying was 8½ days. The blast was put on at 2.35 p.m., October 15. The total time was 31 days 11 hours 50 minutes. The furnace had been in blast from April 15, 1911. It is 21 ft. 6 in. by 90 ft. and has a capacity of 450 tons a day.

REPORT ON CANADIAN RESOURCES.

IN pursuance of its policy to study trade conditions of the various countries of the world, and to publish for the benefit of manufacturers and exporters of the United States the information thus collected, the Bureau of Foreign and domestic Commerce will soon publish a report by Commercial Agent A. G. Robinson concerning the resources, industries and trade of Canada and Newfoundland.

Smoke Abatement in Pittsburg Metallurgical Plants*

By J. M. Searle**

Due to more active steps being taken by the civic rulers of our large manufacturing municipalities, and to a growing realization of economic benefits derivable by the manufacturers themselves relative to the prevention of smoke, considerable activity has been shown and progress made in different directions in the effort to combat the nuisance, and incidentally to conserve fuel.

I WISH to emphasize in this paper the following points:

First.—That the making of smoke is a direct waste of money to the manufacturer.

Second.—How to attain the best economy and at the same time produce a smokeless stack.

Third.—That the soot which colors the products of our furnaces can be, and is, burned, therefore the phrase "Smoke Consumer" is not a misnomer.

Fourth.—That smoke makers for their own protection, should be compelled to arrange their plants so as to render their stacks practically smokeless.

Fifth.—That much smoke does not indicate much prosperity for our cities.

Sixth. — That the smoke-belching stack should be condemned as a menace to every community in which it exists.

Seventh. — That a column of dense smoke belching from any stack is not only useless, but it is also extravagant and easily preventible.

No Mystery in Smokeless Firing.

To one having both practical and theoretical knowledge of the science of the furnace and the chemistry of combustion, which has come to him through many years of patient and untiring effort in actual service, the conditions under which unnecessary smoke may be abated are not mysterious.

Not a year has passed, however, during the last decade that has not witnessed the formation of societies of theorists for the abatement of smoke. These societies usually employ so-called investigators who, at considerable expense, continue their investigations indefinitely. Usually such investigators begin by attempting to devise some undiscovered method for mysteriously abating smoke, and always, of course, in blissful ignorance of the fact that the best trained and most successful engineering minds of the world have given the subject earnest thought for many years and have hundreds of smokeless furnaces to their credit in the mills and factories of various cities, about all of which there lurks no mystery.

Because of their connection with public societies, these investigators have easily reached the ear of the public and have succeeded in having their ideas exploited, but as such devices as these investigators exploit in the public press are usually found impracticable, the general public have come to believe the practical abatement of smoke well nigh impossible, when the contrary is easily true in every instance.

Installation Feature.

Of course, any one of our best and most popular smoke-abating devices known to-day (and there are many such) will fail of its purpose, if improperly installed, but the manufacturer and the combustion engineers, who have made this work their life study, will never permit such error of design or installation. In fact, the manufacturer of a machine-firing device that will eliminate smoke when properly installed will not sell his machine unless proper plant conditions exist. The day has long since passed when any old boiler and setting is considered a good place in which to install a high grade machine fireman.

There is no longer any mystery in the abatement of smoke. Tell the district manager of any of the good stoker manufacturers the maximum capacity you will force your boilers to deliver, and tell him you require this without a smoking stack, and he will never fail to produce the capacity you require with that smokeless stack or chimney. All that any of the good stoker engineers ask today is a free hand and they will produce the desired conditions at your plant. Such conditions may include the re-arrangement to some extent of your combustion chamber and chimney draught, but there is no question as to guaranteed smokeless results by the manufacturer.

Loss From Smoke.

Dense black smoke issuing from a chimney or stack unfailingly indicates waste of fuel. It also as unfailingly indicates the emission of great volumes of invisible carbon monoxide gas, which not only filters into and poisons the atmosphere we all must breathe, but which also robs the plant from which it is emitted of a greater portion of the fuel than (for the same period of time) is being converted into heat-energy for useful work; and this condition, of course, refers to locomotives as well as stationary plants.

When our stacks are smoky we have also an additional loss to the general public, caused by the unnecessary rapid soiling of everything we wear or handle. Who will say that the smoke and grime caused by the imperfect combustion and consequent waste of fuel in the coal-burning furnaces of our large manufacturing centres, do not add at least a dollor a month to the combined laundry and cleaning bills of each individual? and who has the hardihood to suggest that each of us does not pay another dollar a month to the dry goods merchant because of losses sustained in the rapid soiling of fabrics which must not only be exposed to unnecessary soot on shelving and counters, but handled time and again by prospective purchasers?

The Locomotive Stoker.

Probably the most important development in connection with the practical abatement of smoke in the past few years has been that of the successful locomotive mechanical stoker. From a viewpoint of one not familiar with the detail of locomotive construction and operation, it would prbably seem that the development of a locomotive stoker along the lines of well-known stationary practice would be very simple, but when one takes into consideration the limited space available for the application of the stoker to a locomotive, the variation in load, which is from zero to 100 pounds or more fuel burned per square foot of grate area per hour, and the limited space for the construction of the conveyor to convey the coal from the tender to the locomotive proper, and the mechanical abuse that the stoker is subjected to when the machine is run at high speeds, it becomes evident that the field of the locomotive stoker is distinct from that of the stoker which is successful in stationary practice.

The locomotive stoker is now a practical firing machine, after many years of continual experiments in which the railroads have spent large sums of money and a vast amount of patience with unwavering effort.

Requirements in Locomotive Firing.

Each class of locomotive in each class of service requires different treatment, necessitating a large amount of work in the development of the machine for the various services to be met. It is evident that in developing the locomotive stoker, we must meet the following conditions or failure will result:

---

*From a paper presented at a recent meeting of the Pittsburg Foundrymen's Association.

**Chief of Division of Smoke Inspection, Pittsburg, Pa.

1.—We must have a machine capable of generating sufficient steam under all conditions of train lading and speed.

2.—A device to burn the fuel in an efficient manner, and in so doing provide a material reduction in the smoke.

3.—The device to be so constructed that it would form a part of the locomotive itself, and not a temporary attachment subjected to the whims of the operator.

4.—That in the application of the stoker no obstruction should be placed in the way of the fireman as far as access to the coal on the tender or to the fire door in the boiler for properly hand-firing the locomotive, either in combination with the stoker or with the stoker entirely inoperative.

5.—That the device should be of such character that its maintenance cost would be low and that it be simple in operation in order to avoid any additional work upon the fireman in operating it.

Improvement During Present Year.

While the outlook toward smokeless locomotives for Pittsburg has very greatly improved during the year 1913, in fact is much better than at any previous date, the same applies to the mills and factories which are always with us. Our office files, and the stacks and chimneys of our city plants and locomotives for 1913 show a marked improvement in smoke abatement over 1912; and judging from what data we now have for prospective equipment for 1914, the total number for the year 1914 will be greater than that of the smokeless installations made during the year 1913; and this changed condition is largely due to the fact that owners and operators have awakened to the fact that it does not pay to operate with smoky stacks.

A Typical Installation.

An instance of labor and fuel saving too important to pass by at this time without mention came to my notice quite recently. An old plant of 55 boilers had become worn out. The insurance company had cut the pressure to 85 pounds; the mill was loaded down with orders. It was concluded, as a last resort, to find a place to locate an up-to-date plant of boilers and double the steam pressure. Eight 600-horsepower units of the water-tube type fitted with good mechanical stokers were installed.

These eight new boilers are saving in pay roll $1,500 per month, and in coal $3,500 per month, which, as you will note, is $60,000 per annum, or six per cent. on one million dollars.

They have, however, done much more than this; they have increased the capacity of the entire mill, which increase is an additional source of revenue, and they occupy but 4,500 square feet of ground, whereas the 55 boilers which were thrown out occupied 45,000 square feet.

Test Data.

It so happened that an evaporative test was being conducted upon one of these 600 horsepower units on the day the writer last visited this plant, and an average capacity of 948 horsepower had been developed for about six hours. The eight individual stacks were absolutely smokeless and the products of combustion had averaged for this six-hour period 12½ per cent. of CO-2 gas; and yet it is frequently heard among men who call themselves steam engineers that we cannot rush a boiler and maintain a smokeless stack.

This plant, which is saving the interest at 6 per cent. on $1,000,000.00, cost complete, $130,000.00, including steel boiler house, main steam piping, feed pumps, Cochran feed-water heaters, ash and coal-handling devices, the latter being for both river and rail. Can better reasons or stronger argument, be produced for the erection of modern boiler plants than is shown by the books of the company from which I have just quoted, and which refer to eight months' operation of their new boiler plant.

In designing a furnace, we must not forget that no one type of device or appliance will suit all conditions. The smoke problem does not take more kindly to a universal "cure-all" than does the human system. On the contrary, each case of smoke abatement must receive individual treatment, or failure will result.

Fuel Conservation.

It has been said by experts of more or less ability that the coal of this country will last for many centuries at our present rate of mining.

A certain manager sent his fireman to jail for stealing a few hods of coal. A few months later a combustion expert showed this same manager how he could save 20 per cent. of his coal at a very small expenditure. He never budged; he was evidently concerned more in the manner of the loss than the cost of it. There are too many such managers. Too many of them prefer to continue paying the cost of the same needed improvements each year rather than invest the money so wasted in improvements that would at once stop such payments and commence to increase dividends at home, and, in many instances, render their plant a joy rather than a continual nuisance to their neighborhood or community.

Accessory Aids.

It must not be understood that the installation of a good mechanical stoker is the last word in boiler room or metallurgical furnace economy, or smokeless combustion, for such is not true.

If we expect to produce high furnace efficiency and smokeless plants we also need some reliable form of CO-2 recorder in our boiler or furnace rooms; also our pyrometer and differential draughtage must constantly point to results. Then, too, in boiler practice the arrangement and relative position of the absorbing surfaces has much to do with plant efficiency. Also the nature of the load carried must be considered when selecting our machine-firing device.

Again, we must not expect too much of the man in front of the boilers, whom we pay from $1.75 to $2.50 per day. We must not expect such a man to understand the chemistry of the furnace. If we do, we will suffer disappointment, for when he has cleared the cobwebs from his brain sufficiently to appreciate the difference between the value of C-0 and CO-2 gas as heat producers, he will have a better job. No, you must place a practically fool-proof "machine fireman" in the hands of the average coal handler, and instruct him to call the engineer when trouble appears, if you expect to conserve your coal pile and produce high furnace efficiency and a smokeless stack. As time passes, your fireman will perhaps call the engineer less frequently, and finally he will understand and care for the machine himself.

The Evaporative Test.

Engineers have spent much thought and money on compounding high-class reciprocating stationary engines and locomotives, and in designing many types of steam turbines, in order to grab the last unit of energy from the steam they have generated, but in far too many instances they have simply closed their eyes to the appalling waste of energy that is constantly sneaking dividends out of our stacks.

It is still considered quite the proper thing by many of our plant engineers to refer all ills in the boiler house to an evaporative test that records the amount of coal used and water evaporated in a given time, but without any reference to gas analysis. When such a test has been completed, the engineer gathers up his memoranda and proceeds to figure out, as he says, the efficiency of his plant, without a scrap of data as to the composition of his products of combustion.

Does he get much information of value from such a test? Not very much. He has commenced at the wrong end of his job. He should have first gone on a hunt for his percentage of CO-2 (carbon dioxide gas) in his furnace products at the breeching. When he had finally determined this, and had brought it up to his liking, would have been time enough to hunt for the efficiency of his boiler or furnace.

Don't commence at the top to run an efficiency test in a boiler house or on a metallurgical furnace. Commence at the coal pile and go up, if you are really looking for results. If more boiler tests were commenced at the coal pile, carried through the furnace and breeching, and finally to the absorbing surfaces, instead of beginning at the absorbing surfaces, more data of value would be on record, and more smokeless stacks would exist, for after all, the last word in smoke prevention with our high volatile coals is and must remain at least 14 to 16 per cent. of CO-2 gas in our products of the furnace, whether such furnace may be for metallurgical, stationary, or locomotive purposes.

"Burning Smoke."

It has been said that the phrase "smoke consumer" is not scientific and that it should not be used, and that smoke, once formed, cannot be consumed. I wish to make it plain here that while I have much respect for the memory of C. Wye Williams and his valued records of research upon the lines of combustion, I cannot agree with him in this particular instance. What is this thing we are prone to call smoke? What makes it black? Is it not carbon passing into the stack at a temperature so low as to form what we call soot? If it is carbon, and I believe we will all agree that it principally is, what must we do to burn it and convert it into the invisible harmless, heat-producing gas called carbon dioxide, CO-2?

The answer is among the easiest of those that are required of the combustion engineer to-day. Supply two volumes of oxygen to each volume of carbon and the ordinary temperature that should obtain in any combustion chamber under any boiler or in any metallurgical furnace, and so arrange your combustion chamber as to force as nearly perfect contact of your oxygen and your carbon particles as may be found practicable, and your soot will never get through that combustion chamber, no matter how dense and black it passes over the bridge wall.

Stack Records.

Some may ask, how are we to know when we have the correct, or approximately correct, volume of air for complete combustion?

First, and accurately, by the use of a good CO-2 Recorder. Second, and approximately, by the intelligent and occasional observation of the top of your stack. Never (when you are not using a CO-2 recorder) let the top of your stack run absolutely clear, if you expect the best average efficiency from your furnace. Carry a haze at your chimney top equal to about 1-10 of No. 1 "Ringlemann," and you will be sure of having a high average percentage of CO-2 in your products of combustion. If, on the other hand, you have no combustion recorder to guide you, and you are running an absolutely clear stack, your surplus air may not only be enough, but it may be many times more than is required for high furnace efficiency, and while a practically smokeless stack always accompanies high furnace efficiency, on the contrary, as you have seen, a smokeless stack does not always indicate such efficiency.

Burning the Gases.

The greatest difficulty in burning bituminous coal smokelessly and with high furnace efficiency lies in the fact that it burns partly as a solid and partly as a gas, and that the gas must be burned in a time much shorter than is required to burn the solids. It may be of interest to note here that 100 analyses recently made have shown that an average of 42 3-10 per cent. of the total heat developed by average Pittsburgh coal is contained in the volatile combustibles, and for the combustion of this hydro-carbon content, a fixed portion of our total air supply is required over the fire.

After some thirteen years, during which I have been constantly in touch with the steam engineers of Pittsburgh, I feel safe in offering the suggestion that these last two conditions are not given the careful consideration that is bestowed upon other details of plant operation. In other words, the adequate supply of oxygen over the fire at the moment when something like 40 per cent. of our gaseous and extremely valuable hydro-carbons are being distilled is rarely, if ever present. In fact, very few plant engineers dig down into the science of the question at all. If they did, the thought would quickly occur to them that we get no smoke from the solids in the fuel (the coke), therefore we must get it, if at all, from the volatile constituents, and if these contain fuel to any appreciable extent, we had better get busy and convert this fuel into useful energy.

When the careful engineer visits a power plant in some one of our good city buildings or mills, and notes the perfect order and organization in the engine room, including expensive compound condensing engines, and then remembers that the boiler stacks issue excessive volumes of smoke, it must indeed, to use a homely phrase, suggest "saving at the spigot and wasting at the bung hole."

◆

Oil Ring Bearing Query.—On my dynamo the oil ring bearing next to pulley throws the oil out at the ends. I would like to know the cause of the trouble and how I can remedy it.—George Munro.

ELEVATOR CONSTRUCTION.

MONTREAL members of the Canadian Society of Civil Engineers were treated on October 16 to an address by Mr. James Spelman vice-president of the John S. Metcalf Co., on the development of the construction of grain elevators, a branch of engineering which is attracting more and more attention in Canada yearly.

Mr. Spelman's address, which was illustrated with lantern slides, covered the history of construction from the day of the old-time millwright, who used only his natural judgment and common-sense in erecting a building of sufficient strength for the purpose required, to the present day, when enormous structures are put up, every feature of which is calculated to a nicety on engineering principles, stress, pressure, spout capacity and evenness of flow, etc., being determined before a steel bar is put up. Screens were shown of elevators in course of construction and completed, among the most modern of which were the Harbor Commissioners' elevators of Montreal.

Discussion.

Following the address, a discussion was entered into by the members, Mr. J. A. Jamieson, an elevator construction engineer, pointing out that the greatest problem in the handling of grain to-day was not so much the style of elevator construction as a matter of expedition and economy. Even with the latest appliances, the handling of grain in elevators, and the loading and unloading from cars and vessels, were subject to delays. Elevators in some cases had been put up more with a view to storage capacity than economic handling of grain per bushel, and he thought the problem of the future would be to secure expeditious and more economic handling.

Mr. F. W. Cowie, chief engineer of the Montreal Harbor Commission thought the construction of elevators would for a long time remain a field for specialists, on account of the special design and intricacies of the machinery required. It was pointed out that the Montreal Harbor Commissioners' elevators had tremendously increased the grain capacity of this port. In the past six years elevators had been constructed in Montreal at a capital cost of four and a half million dollars, handling at the rate of forty-five million bushels a year, and earning a revnue of $250,000, while the grain was handled in them at a rate of 7-10 of a cent a bushel.

Mr. C. N. Monserrat, chairman and chief engineer of the Quebec Bridge Commmission, presided at the meeting, which was well attended.

SHIPBUILDING AT MONTREAL.

CONSIDERABLE space has been devoted in the present week's issue of our journal to an article covering the reasonableness of having a naval and mercantile marine engineering and shipbuilding plant established at Montreal; to the steps being taken to gradually evolve and develop same; to a consideration of the personnel and capacity of its sponsors; to a descriptive sketch of what has already been accomplished and indicating in more or less detail, the individual plant units and their contained equipment as embraced in the general scheme.

The undertaking is such as to have required careful consideration and due weighing of the many circumstances, climatic, geographical, and a host of others. In view of this, when we find one of the best known and successful naval and mercantile marine equipment manufacturers lending not only their support, but world-wide experience as well to this enterprise at the head of navigation on the St. Lawrence, it is almost impossible to come to any other conclusion than that shipbuilding will yet take a place in the front rank of Canadian industries.

On previous occasions, in these columns, reference has been made to the opportunity that shipbuilding and marine engineering affords in an industrial sense, not only for their own sake, but also because of the accessory trades and manufactures which follow in their train. We do not believe that sufficient encouragement has been given those already established plants by our different Governments, and that while a more or less extravagant proposal —in the sense that as a nation we were entirely unprepared and incapable of giving satisfactory performance, to proceed to build a Canadian Navy, was made by the late Government, it must be remembered that cultivation and propagation of the industry of shipbuilding as it presently exists, will do more to put it on a sound basis than is otherwise possible.

In the article referred to, the naval feature occupies a prominent place, as a matter of fact, too prominent, we think, so far as the class of vessel is concerned. We are not disposed to take the building of "Dreadnoughts" at Montreal, too seriously, and we really wonder if even those behind the shipyard proposition there, have any very real anticipation of doing so. We do not question the possibility of building this type ship, so much as believing it to be more of a problem to get these leviathans into deep water, in which they can be handled and manipulated with safety, not only to themselves, but to navigation in the St. Lawrence generally. That river record for merchant vessels of much less tonnage, much less draft of water, and much less construction cost, does not admit of the absence of serious doubt as to probable mishap and inconvenience. So far as the building of the smaller class of warship is concerned there should be absolutely no difficulty, and as regards the production of merchant vessels of size equal to the largest ocean liners sailing now to Montreal, there is no obstacle evident that cannot be easily overcome.

The pilot question, if no action be taken in the interval, will thrust itself with a good deal of insistence on the responsible Government, when the navigation of warships to and from the shipyard and drydock at Montreal develops into a reality, and if past experiences count for anything, and attempt at "Dreadnought" navigation from cradle to ocean be made, we are pretty well convinced that few, if any of this type vessel will get very far from their birthplace.

The Canadian Vickers Co., are, however, to be congratulated on the enterprise shown in tackling what is beyond question a weighty undertaking, and all who have the welfare of our country at heart, in any sense, but more particularly in its industrial aspect, will wish them in the coming years, a measure of success commensurate with the responsibility undertaken.

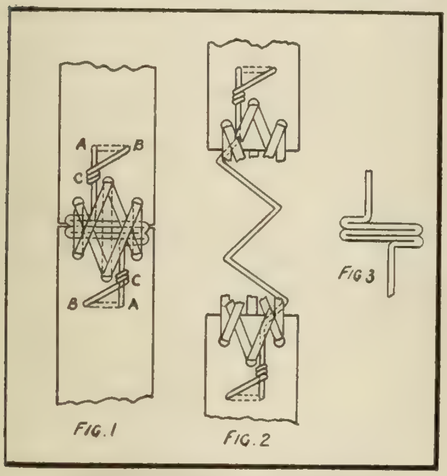
SAFETY KINK FOR BELTS.

By J. C. E.

MANY serious accidents have occurred on account of belts breaking and the ends come flapping down and striking workmen. It is seldom that a belt parts or breaks in two, other than at the lacings, or the holes giving way where the lacing passes through. In the enclosed sketch is shown a kink that will prevent a belt from falling when the lacing breaks or pulls out.

In Fig. 1, is shown a piece of insulated belt-wire. It is bent up in folds, see Fig. 3, and placed on the belt when it is being laced up—the lacing holding it in position. The ends are placed through holes at (A), then bent at right angles on the inside of the belt, and passed out again through the holes at (B). The ends are also twisted a few times around the wire at (C). When the belt lacing breaks, or the holes give out, the belt ends will then draw apart, and the folds in the wire will be drawn out also. This renders the belt slack, and, instead of falling, it will only lay or remain at rest on the shafts. Fig. 2 shows a broken belt pulled apart. A number of these wires should be made up and kept on hand for emergencies.



SAFETY KINK FOR BELTS.

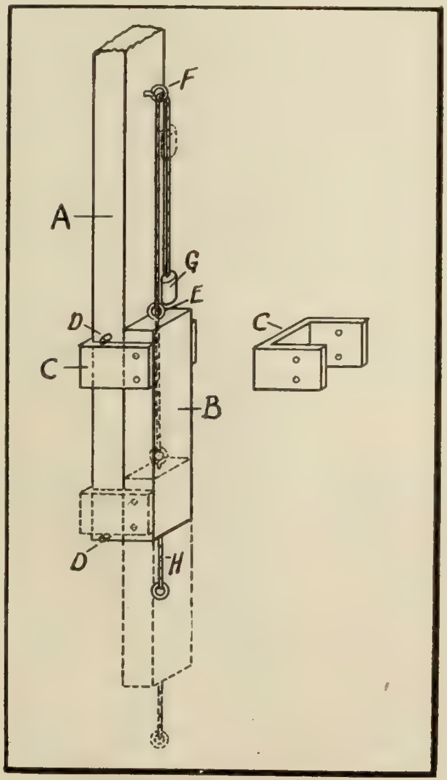
SAFETY BELT SHIFTER.

By James E. Cooley.

IN nearly every factory there are to be seen a number of "belt shifters" extending down so low, that employes working near are constantly banging their heads up against them. Many workmen have been nearly knocked out, or have received deep cuts from these belt-shifters. If a "shifter" is up too high, a short person cannot reach it, besides it is necessary that it be as low down as possible, so that it can be grasped firmly, and the arm movement be directly forward from the shoulder.

In the accompanying sketch is shown a "belt shifter" that can be left as high as necessary, and yet the shortest person can reach it. A guide (C) is made from a piece of sheet iron and fastened to a wood extension (B), which is then placed on the shifter (A). Two pins are driven in the side of the shifter at (D), and act as a stop when the extension is moved down and up. Two screw-eyes (E) and (F) are placed as shown. Attached to (E) is a light chain, that slides through (F), having a small counterweight (G) fastened on the end. A similar chain, any convenient length, is placed at (H).

The method of operating is simply to pull down on the chain (H), grasp the extension (B), and move the "shifter" as required, then by letting go, the weight (G) pulls it up out of the way. There is no danger then, that it can ever be left down. The chain (H) should be long enough so that the shortest person can reach it. It can never do any harm when run into.



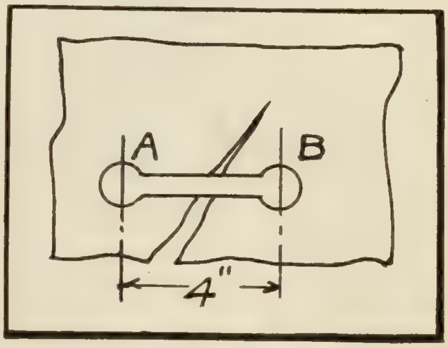
SAFETY BELT SHIFTER.

REPAIRING CRACKED FACE WITHOUT PATCH.

By William Stewart.

TO repair any working face which is cracked and where it is undesirable or impossible to fit a patch with screws or rivets:—

Drill with flat drill the holes (A) and (B), 1½ inch diameter by ⅜ inch deep by 4 inches apart. Next, cut with a cross cut, the space between, ¾ inch wide and ⅜ inch deep. Mark out a piece of ⅜ inch bar iron to the same sizes with the exception of length, which should be ⅛ inch shorter. Make it red hot; it will then fit exactly, and by action of cooling will draw the cracked piece of machinery tightly together. File off any burs showing after which the job is repaired solidly and neatly, with exactly its original fit.



CRACKED WORKING FACE REPAIR.

ENGINE TESTS FOR MISALIGNMENT.

By James E. McCormack.

HEREWITH are some engine tests which I have found useful. The fact that a number of men have (after assisting me to make these tests on the engines which they themselves were in charge of) voluntarily assured me that they had never before seen similar tests applied emboldens me to offer them this:

If a clean, properly-designed and properly lubricated crank pin bearing persistently heats when keyed just tight enough to eliminate the knock, the trouble may be due to the crank shaft or the crank pin being out of line, or to the bore of the crank pin brasses not being at right angles to the centre line of the connecting rod.

Test Procedure.

To test for these defects, on an engine that has run long enough to have its brasses bedded to fit the crank pin properly throughout its whole length, uncouple the connecting rod at the cross-head end and adjust the crank pin brasses so that they lightly bind on the pin. This can be ascertained by moving the disconnected end of the rod back and forth. Next, put the brasses and keys in the cross-head end of the rod, but keep it disconnected from the cross-head. Now move the cross-head so that the brasses in the rod stand directly over the cross-head journal and note if they do stand directly over or a little to one side.

The crank should now be moved one-quarter revolution, and the detached connecting rod end again lowered onto its journal, the operation being repeated at each quarter revolution, preferably at the dead centres and mid-strokes. If in each case the rod end falls into its place without requiring to be sprung or forced sideways, it is proof that the main shaft, crank-pin and crank-pin brasses are all true. If the rod stands to one and the same side equally at all four points of the revolution, it is proof that while the shaft and crank-pin are true, the bore of the brasses is not at right angles to the centre line of the connecting-rod. If the rod end varies, passing during a revolution sideways over both sides of the cross-head journal, it shows the crank-pin to be out of line. If it varies, but always remains on the same side of the journal, it is the main shaft that is out of line.

Under the above conditions, to hold the rod end to its place at all times would require a strain sufficient to spring the rod by force, and this strain would be transmitted to the crank and cross-head pins through their boxes, and as the direction of the strain reverses with each stroke, it produces a knock.

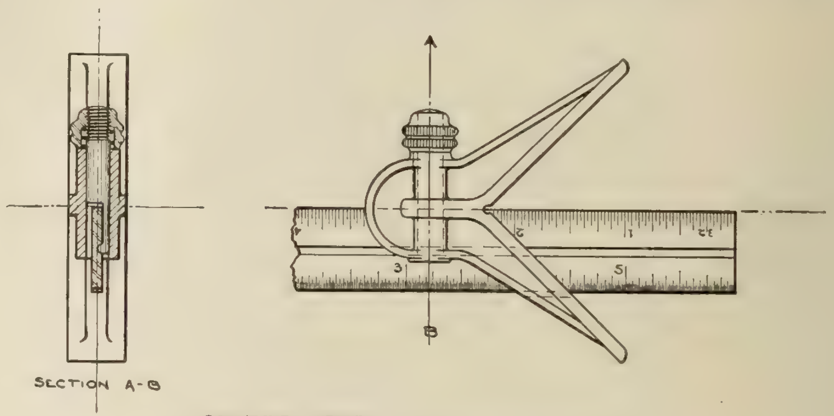
If the crank shaft is level, but is not at right angles to the line of the engine, or if the outer end of the crank-pin is inclined upward when the engine is at mid-stroke, either top or bottom, then this strain will be greatest when the engine is at the dead centres, but if the outboard end of the crank shaft is high or low, or if the outer end of the crank-pin is inclined upward, most when the engine is on one dead centre, then this greatest variation and the greatest strain will be at mid-stroke, and it is not at these points that the resulting knock will occur.

The cross-head pin and the bore of the cross-head end brasses may be examined in the same manner, except that it is not necessary to test these at four different points. If either are out of line, you can make certain which is at fault simply by (where possible) connecting the rod to the pin upside down, and then if the fault is in the brasses, they, being now upside down, will incline the rod to the opposite side from where it stood when connected right side up. This test is very seldom necessary owing to the small amount of wear at this point.

Adjustment Pointers.

I will now conclude by mentioning a couple of items which, although most generally known, may be of assistance to some of the beginners who are readers also.

When adjusting the connecting rod brasses it is well to have the engine on centre for adjusting the crank-pin brasses, and at mid-stroke for adjusting the cross-head journal brasses, for by this method the brasses are keyed to fit the least worn or "high" sides of the pins.



SECTION A-B

CENTER HEAD

STARRETT COMBINATION SET FEATURES.

Sometimes when an engine develops a knock, which occurs only once in each revolution, the knock may be caused by the clearance between the piston and the cylinder head not being equal at each end of the stroke, or it may be the result of too early admission or too late a release at one end, either of which can be detected by means of an indicator, and the rods adjusted accordingly. Of course, it is well to be sure that the knock is not due to improper adjustment of the guides or unequal clearance before changing the valves.

◆

DEVELOPMENT OF THE MECHANIC'S COMBINATION SET.

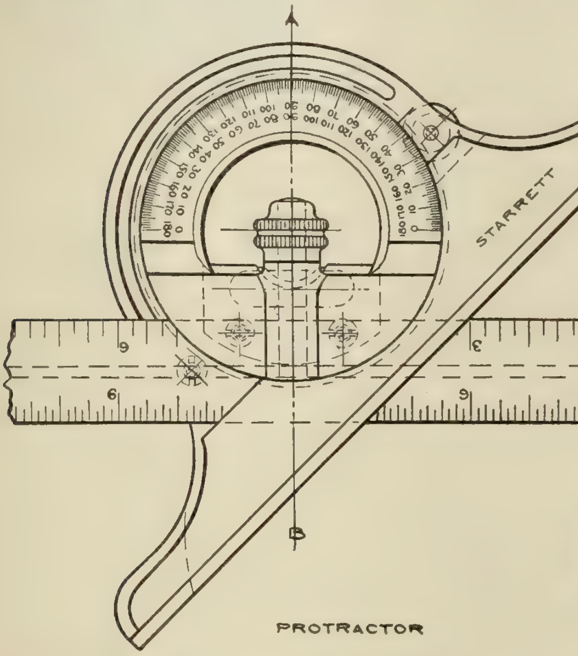
THAT much overworked word, "efficiency," the slogan of the mechanical and engineering world to-day, has been and is behind the studies of every motion which men make in their day's work. Not only is much attention paid to the operations of the workmen, with a view towards eliminating those motions which are not essentially result producers, but the equipment they use is as carefully studied to insure every convenience for quicker and easier work. Only those tools or parts of tools are retained which actually aid in the production of the desired result. The study of this problem of greater results with less effort is a relatively modern one. Yet, nearly forty years ago a man, now famous in the mechanical world, concentrated his efforts on one phase of this problem and produced a tool which has since worked wonders in advancing the capacity of mechanics to turn out better work.

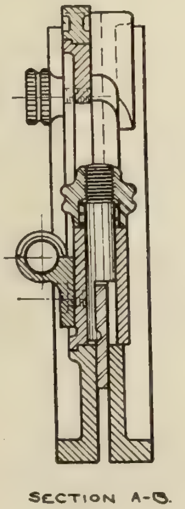
When L. S. Starrett started work, he developed a tool to take the place of the steel rule and try-square with graduated blade, which he felt were unnecessary duplications. As he studied, he also saw how these two tools might be combined with others. He, therefore, experimented with many forms of combinations until he finally selected the method now used. This method consisted, first, of milling a half-round groove along the centre of one side of a steel rule. In the head of a try-square there was also milled a slot wide enough to slide the rule through. With the lower edge of the rule on the bottom of this slot, a lock bolt is fitted in such a manner as to guide the sliding of the rule. The lock bolt could be raised or lowered by turning a thumb screw, and the rule could slide into the head of the square, and be locked at any desired position by setting up on the thumb screw, thereby clamping the lock bolt against the groove in the rule and preventing further sliding. The results obtained by the combination of the rule and square were so satisfactory that Mr. Starrett added still other tools to the combination.

By adding to the head of the square another surface at an angle of 45 degrees to the rule, the tool became a 45 degrees mitre. Next, into the web containing the square and mitre surfaces, a small level was set. Then, finally, a hole was bored in the bottom of the square, and fitted with a brass bushing which held a small scriber, thus what corresponds to the fixed head of an ordinary square became a square, level and mitre. In addition, a handy scriber was provided, and the sliding feature permitted use as a depth gauge or marking gauge.

Considering further possible extensions for the scope of this new tool, it was realized that one of the commonest processes is that of centering round pieces, consequently, a centre head was added to the combination square, making it slide on and fasten with a thumb screw, just as the head of the square does. In this form the first attempt to market the tool was made. Mr. Starrett made personal trips to various large machine shops educating workmen to the advantages of the combination and soliciting orders. So rapidly did the new tool impress itself in favor with workmen that for a while to manufacture it in sufficient quantities was the greatest problem. When the manufacturing end was finally running smoothly and the general supervision left to subordinates, Mr. Starrett began applying himself to improve the tool.

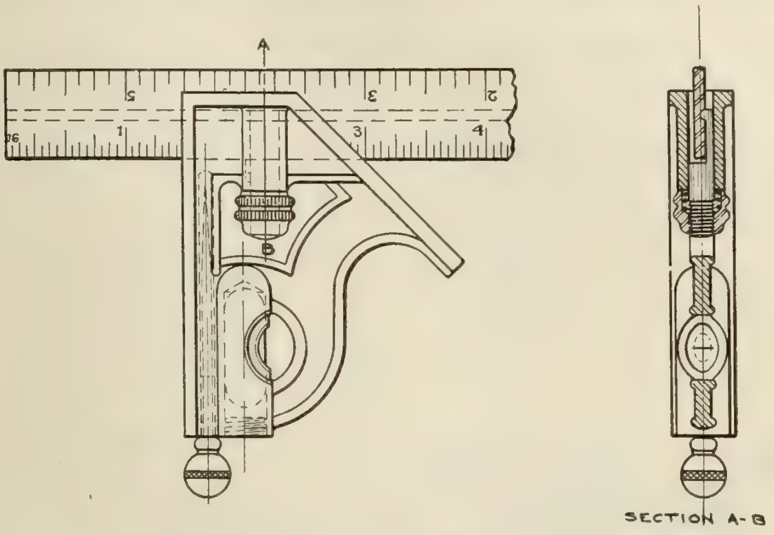
Provided now with removable heads, it was logical that any other improvement should be in the nature of an additional head for any new purpose. A protractor head provided with a long bearing edge and clamping attachment was added. In this was fixed a spirit level, so arranged that with it, to indicate the horizontal, the protractor could be made to show the angular deviation therefrom. In addition, the protractor and rule make a most convenient tool for laying out angles.





STARRETT COMBINATION SET FEATURES.

The complete combination set as now manufactured consists of four parts, the groover rule and the three heads—square and mitre head, centre head, and protractor head. The rule is graduated along all four edges in desirable units, such as 8ths, 16ths, 32nds and 64ths, or 100ths of an inch, or in metric units. Any of the heads will easily slide off or on instantly, and may be used independently or in conjunction with either of the others. The tool takes up far less room than would separate tools of equal scope, and is much more convenient. With this combination set, a mechanic is enabled to do more work and do it easier.



STARRETT COMBINATION SET FEATURES.

In connection with the story of the development of the combination set, it is an interesting fact that commercially the Starrett tools met with such success that the business grew from practically nothing up to its present prominence and distinction as a corporate body doing business under the name of the L. S. Starrett Co., and known throughout manufacturing circles as "The World's Great Toolmakers."

* * *

LABOR STATISTICS.

According to the record maintained in the Department of Labor, there was continued improvement in September. There was a still further decrease in the number of strikes and lockouts in existence, and a favorable record is shown when a comparison is made with the same month of last year. There were altogether eleven trade disputes in existence throughout the country, as compared with eighteen last month, and twenty-one during September, 1912. Only two of these occurred during September.

Of those in existence before that time, the only one of importance as affecting industrial conditions to any great extent was that of the coal miners on Vancouver Island, which remained unsettled at the end of the month, although there were not so many men out of work as a result of it as before. Upwards of 78,000 working days were lost through strikes during September, as compared with a loss of 109,530 during the preceding month.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

NEW LANDIS SIX CHASER STATIONARY PIPE DIE HEAD.

THERE is here illustrated a new pipe die head, recently placed on the market by the Landis Machine Co., of Waynesboro, Pa. The head is extremely simple in construction, and is applicable to certain pipe machines of the rotating pipe type. A general idea of its operation may be obtained from Fig. 1. As will be noted, the head is composed of four major parts—namely, the head body, which carries the chaser slides; the chaser slides; the operating ring which imparts the oscillatory motion of the handle to the chaser slide, giving the chasers a universal radial movement to and from the centre; and the chasers.

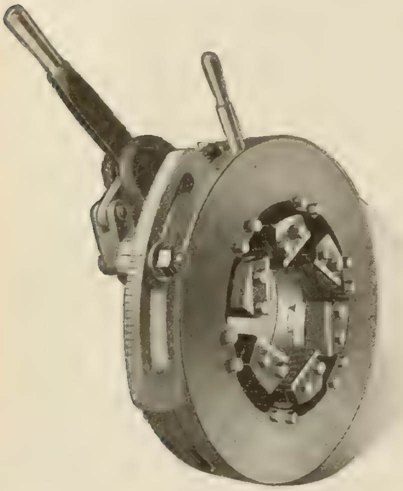


FIG. 1. LANDIS NEW PIPE DIE HEAD.

There are several important characteristics of this die that are worthy of note. Its life, it is claimed, is many times greater than that of the ordinary hobbed type die. Moreover, the line contact which the chasers have with the work reduces the friction to a minimum, and permits of much higher cutting speeds. This increase in speed is augmented by the flexible rake feature, which makes it possible to obtain the best cutting condition and to successfully thread all grades of pipe, whether iron, steel, brass or copper.

Since the lengths of thread on the standard sizes of pipe are fixed, a die that requires grinding in the throat is of little or no value, as a few grindings will cause the length of thread to fall below the standard. This objection is eliminated with the Landis die, since the cutting contour is always the same, due to the fact that the chasers are ground on their inner ends, and never on the bevel surfaces which form the throat.

At a recent test made in the plant of one of the largest Eastern pipe mills, a circumferential cutting speed of 40 feet per minute was maintained. This means that the various sizes of pipe were rotated in accordance with the accompanying table:

Size of Pipe.	Revs. per min.	Ft. per min.
3/8 in.	227	40
1/2 in.	181	40
3/4 in.	144	40
1 in.	116	40
1 1/4 in.	98	40
1 1/2 in.	79	40
2 in.	64	40

As one set of dies covers the entire range on all sizes of standard pipe where the pitch is the same, it is unnecessary to remove the chasers from their holders, except for grinding purposes. Their removal is accomplished by slackening the two chaser clamping screws on each chaser holder just enough to allow the chasers to be slipped from their seats. They are set to the proper position by bringing the cutting edges flush with the flat surfaces on the chaser slide, provided for that purpose. A steel scale or straight edge will simplify this operation. Mention should be made of the mill chaser clamps which overhang the chasers and protect them against split and twisted pipe.

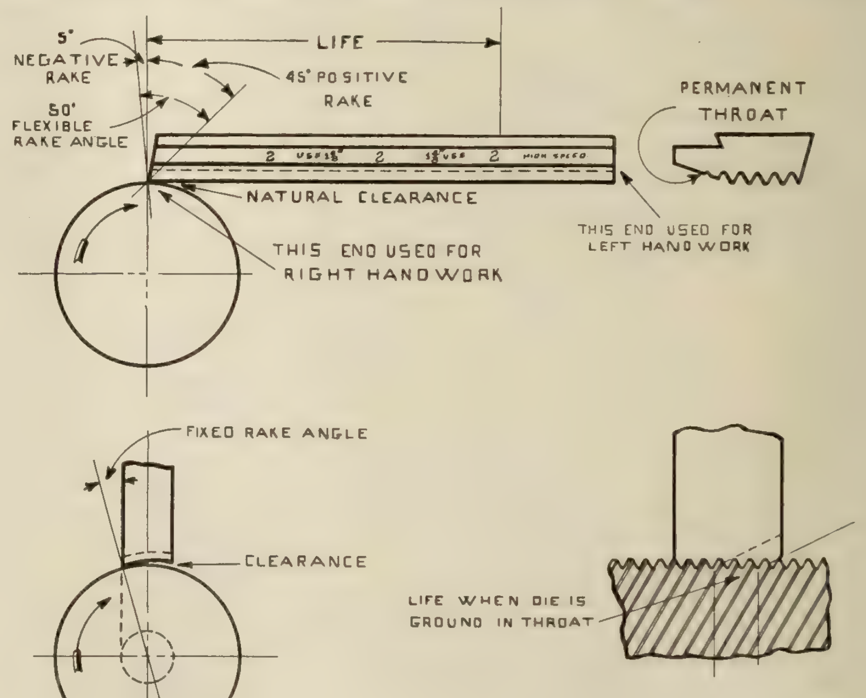

FIG. 2. DESIGN FEATURES, LANDIS NEW PIPE DIE HEAD.

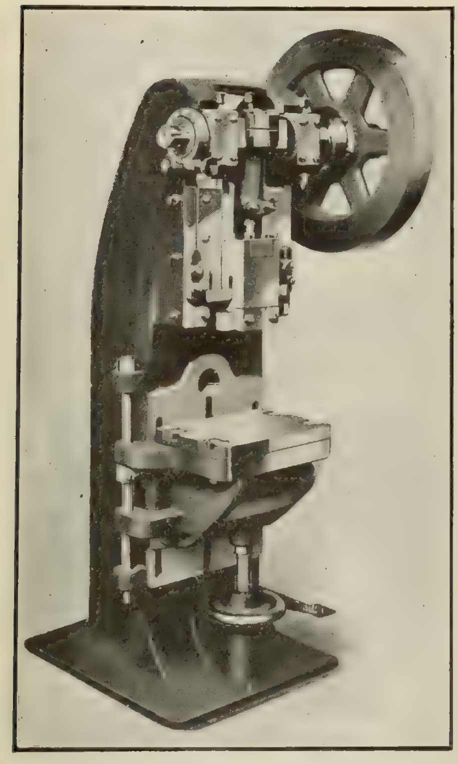
The makers call attention to the economy of this die as far as equipment and upkeep are concerned. The chasers, which can be used on all sizes of standard pipe where the pitch is the same, are hard throughout their entire length, and never require annealing, hobbing or re-tempering. They are also interchangeable; that is, any one or more of a set can be replaced without renewing the entire die. Every feature tending toward economy and increased output has been incorporated in this head.

* * *

HORNING AND WIRING PRESS.

A NEW horning and wiring press developed by The Cleveland Machine & Mfg. Co., Cleveland, Ohio, has been put on the market. In its construction is embodied the special "Cleveland" features recently described on their inclinable presses, viz.: bronze bushings for shaft bearings in frame and fly wheel, safety latch on clutch pin, increased diameter of crank pin, hinged brake band with compensating spring for wear and expansion, and quick adjusting knock-out device.

This machine is used largely for the operation of wiring dies, for wiring the edges of pails, cups, reflectors, etc. The frame is bored for a horn. These horns may be either plain for holding, piercing or riveting dies, or of duplex construction for folding and locking side seams on pails, tubs, furnace pipe, and other articles made out of tin or light sheet steel. The screw adjustment under the knee permits setting it to any desired height for wiring dies of different depth. When using the press with a horn, the screw is lowered and the knee is swung around out of the way of the operator.



NEW HORNING AND WIRING PRESS.

This machine, known as No. 24, is one of four sizes of the same general design. It weighs 1,850 pounds, and occupies a floor space of 28 in. by 30 in.

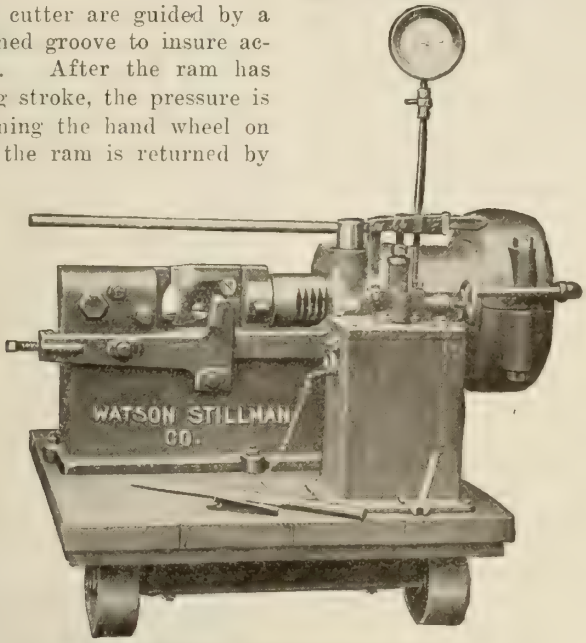
* * *

HORIZONTAL HYDRAULIC SHEAR.

THIS horizontal shear of 175 tons capacity for cutting 4½ inch steel cables and large sizes of rolled steel has just been put on the market by the Watson-Stillman Co., 50 Church Street, New York. It is evident that a horizontal shear of this type has several advantages over those of vertical type, permitting as it does more convenient handling of material to and from the tool. In shops where traveling cranes are used to carry the stock, the advantage is still greater.

Because of its weight, the tool is mounted on flat wheels to render it more convenient for use wherever needed in shipyards, factories or machine shops. The pump is entirely independent of the cylinder, making the valves and pump parts easily accessible. In shops equipped with an hydraulic system, the hand pump may be eliminated and direct connection made to the high pressure pipe line.

The ram and cutter are guided by a carefully machined groove to insure accurate shearing. After the ram has made its cutting stroke, the pressure is released by turning the hand wheel on the pump, and the ram is returned by the rack, pinion and lever arrangement. The pinion lever is shown pointing toward the left. The teeth of the rack and pinion are protected from excessive stresses due to the jump of the ram at the instant of rupture by mounting the pinion upon a spring. The gauge, directly connected with the pipe line, indicates the exact pressure at all times.



HORIZONTAL HYDRAULIC SHEAR.

This tool represents many years of experience in the manufacture of hydraulic shears, and cost, strength, durability, simplicity and efficiency seem to have been as carefully combined as possible, making an ideal tool for shops where much large stock must be cut.

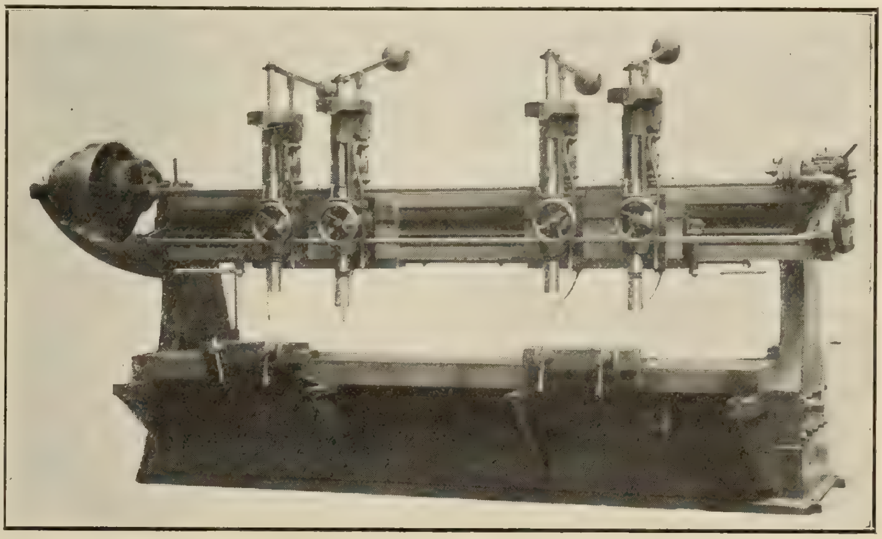
MUD RING AND FLUE SHEET DRILL.

THE four spindle machine shown herewith has been brought out by the Foote-Burt Co., of Cleveland, Ohio, and is intended for use in railroad locomotive boiler shops and general boiler shops for drilling the rivet holes around a mud ring, and for cutting out the flue holes in a flue sheet. The spindles are of the independent feed type, each one being arranged with automatic knock-off to power feed, and the quick return of same is taken care of by the use of a hand wheel located on the front of the head. Each spindle is also arranged with clutch for stopping and starting, and interlocking mechanism so that the feed cannot be thrown in with the



FOOTE-BURT NO. 2 MUD RING AND FLUE SHEET DRILL.

spindle stopped or vice versa. With this independent feed feature, some of the spindles are always drilling while the operator is setting the other spindles, so that the full efficiency of both the machine and the operator is obtainable.

The spindles of this machine are arranged in pairs, mounted on auxiliary cross rails, and are adjustable on these cross rails to a minimum centre distance of 8 inches. The advantage of this feature is that it is possible to set the spindles to the proper spacing of the rivet or flue holes, and then adjust two spindles along the main rail of the machine, maintaining the proper spacing and eliminating the necessity of spacing each one individually. The spindles overhang the front edge of the base 8 inches, to take care of the mud ring work, and the table is provided with chucks for holding the mud rings. The table has an in-and-out motion of 36 inches, and is supported out under the spindles by the bracket slides on the front of the base.

Three changes of power feed are provided, any one of which is instantly available by simply shifting a lever at the right hand end of the machine. Six changes of speed are provided by three step cone and throw-out back gears. The machine weighs approximately 21,000 lbs.

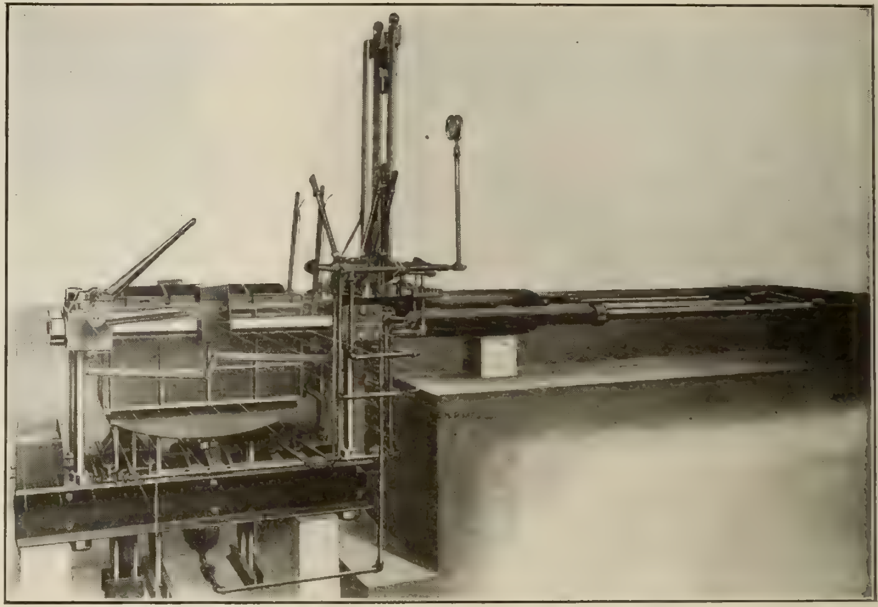
◆

200 TON HORIZONTAL SHEET METAL SCRAP HYDRAULIC BALING PRESS.

THE illustration shows a new type of sheet metal scrap baling press, recently designed and built by the Hydraulic Press Mfg. Co., Mount Gilead, Ohio. This press is operated by hydraulic pressure and fills a long-felt need in the iron and steel field. It will bale sheet metal scrap up to No. 10 gauge, and is of the horizontal type. It is installed so that the top of the box is flush with the floor line, making it convenient for forking the scrap from the floor into the press without elevating it. The box is 20 in. wide, 30 in. deep, and 60 in. long. The normal size of the pressed bale is 10 x 12 x 20 in., and weight 250 lbs. The cast steel door forming the top of the box is counterweighted, and can be moved easily with the hand lever. This door unlocks and opens automatically as the horizontal ram returns to its starting position after the bale has been formed.

The press is equipped with two hydraulic cylinders for pressure purposes, one for compressing the material into the top of the box, and the other for compressing the material into the end of the box. To the horizontal cylinder is attached two auxiliary cylinders for returning the horizontal ram. The pressure platen forming the bottom of the box is locked into position by two lock bolts passing into each end of the platen, and which are operated by hydraulic pressure after the platen completes its upward movement. This saves the platen from tilting strains, while the horizontal pressure platen travels across it during its movement in pressing the material into the end of the box. These lock bolts are also removed at the proper time by hydraulic pressure.

In the head end of the lower platen, which forms the bottom of the box, is fitted a small ejecting platen, to which is attached a 4 inch ram working in an ejecting cylinder located on the sills in the head end of the press. As the lower platen travels upward, it carries with it the ejecting platen and ram which permits the 4 inch cylinder to fill from the pump reservoir by gravity. As soon as the scrap metal has been pressed into a bale, the door forming the top of the box opens automatically, as already described, and the pressure is applied to the ejecting cylinder which causes its ram and platen to rise, thus forcing the bale out of the box level with the floor line, where it can be easily removed.



200 TON HORIZONTAL BALING PRESS FOR SHEET METAL SCRAP.

The valve equipment required for performing all of the operations here described is controlled by an interlocking device, which compels the operator to throw each valve lever in its proper turn, it being impossible to operate in any other manner. A tell-tale board with graduations and indicator weights governed by cables attached to moving parts of the press indicates to the operator the position at all times of the vertical and horizontal pressure platen.

The press is built strong and rigid throughout, steel being used in all parts receiving the strains.

◆

CONTROL APPARATUS FOR ELECTRIC MAINS.

IT has often been desired to control apparatus connected to public electric mains by some means which could be put into operation at the central station without the provision of special leads for the purpose. Many suggestions have been made, such as the reversing of the mains, or by earthing one pole at the station when it was desired to operate the distant mechanism. So far, however, no very practical result has been effected, as such means as those just mentioned have obvious disadvantages. Control from a distance is particularly desirable in the case of street lighting. At present clockwork switches are used to some extent so as to get over the difficulty, and where these are not used—and even where they are in use to some extent—a lamplighter is required to make his rounds in order to illuminate and to extinguish the lamps at the desired hours.

Apart from the question of the cost of labor involved, this method leads to the switching on many of the lamps considerably in advance of the time when they are really required, and, similarly, the extinction of a large proportion of the lamps is delayed beyond the hour when lamps are necessary owing to the fact that a considerable time is taken in making the rounds. So far, gas has been in a happier position, for it is possible to turn street lamps on or off by a variation in the pressure, and thus in competing against electricity for street lighting, gas has been at an advantage.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada
To Achieve and Maintain a Dominant Place in the Markets of the World

GRAIN EXPORT.

THE export of grain from the port of Montreal for the present season will be from sixty to sixty-five million bushels, according to an estimate which has been made at the offices of the Harbor Commissioners. This output will be double, or more than double, the quantity exported last season, which measured up to rather more than thirty million bushels.

Grain received in the harbor elevators to date is estimated at fifty-one million bushels from the commencement of the season. At the present moment there are only two and a quarter million bushels in the Harbor Commissioners' elevators, and not more than about a quarter of a million bushels in the Grand Trunk elevator, so that there is space for the accommodation of another million and a half bushels.

That the spare space will be needed before the end of the season, and will, indeed, probably be overtaxed, is evident from official reports which have been received from inland ports. There were 20,000,000 bushels in the elevators at Fort William on October 9, and the quantity is now almost certainly greater, while the elevators at Tiffin, Goderich, Depot Harbor, Midland, Owen Sound, Point Edward, Port Colborne and Port McNicoll are packed.

Grain is being sent down to Montreal as speedily as possible, but just at present there is a shortage of cars available on the Grand Trunk, so that water transit is the only means available, practically, for sending the grain, but further facilities will be provided just as soon as the difficulty caused by the temporary car shortage can be overcome.

ST. JOHN, N.B., AND THE C. P. R.

CONSTERNATION was caused in St. John recently when it was learned that the C.P.R. had made Halifax the only point of call during the coming winter. Sir Thomas Shaughnessy, interviewed about the change in the company's policy, said:

"St. John is the Canadian Pacific Co.'s winter port, and traffic handled to and from Halifax is by grace of the Intercolonial Railway Co. The Atlantic mail service during the past few years has been most unsatisfactory. The call at both Halifax and St. John involved undue risk to the vessels in making the trip between the two ports along the coast of Nova Scotia in all sorts of weather, and eastbound passengers who embarked at St. John were necessarily subjected to a delay at Halifax of from twelve to twenty hours. The company would have sacrificed its interests in the mail subsidy rather than make the two calls again. With St. John the Atlantic terminus of the company's lines, it would have been natural to adopt that port, but the outlook for steamship traffic during the coming winter made it evident that the facilities at West St. John would be overtaxed if an attempt were made to handle the two Empresses there as well as the large fleet of other steamers that will make St. John their port this winter. The arrangement is only a tenative one and will be subject to revision when St. John has the harbor and wharf facilities properly to accommodate the ocean traffic naturally tributary to the port. The company decided upon its policy after the subject had received grave consideration and the Government was no factor in its determination."

A settlement of the difficulty in connection with the St. John, N.B. protest against the withdrawal of the C. P. R. Empress liners and the Allan liners, Calgarian and Alsatian, from that port, has, it is said, been reached between the steamship authorities and the delegation which waited upon Mr. Borden at Ottawa.

The result was, it is understood, that the C. P. R., although they will take away the Empress liners, will next winter replace them with two new steamers, the building of which is well under way. They will be of the one-class type, with a cargo capacity of 6,000 tons. They will be able to carry 520 second-class, and 1,200 third-class passengers.

St. John will have as many mail steamers calling as before, for according to a high official of a trans-Atlantic steamship line, arrangements have been made whereby the Canadian Northern "Royal" steamers will make St. John their port of call, which, with the two Allan mail steamers calling there each month, will give them a weekly mail service as before.

SHIPPING MEN WAIT ON GOVERNMENT.

A DEPUTATION of the officers and members of the Dominion Marine Association, representing practically all the Canadian marine interests on the Great Lakes, waited on Hon. Geo. E. Foster, Minister of Trade and Commerce, and Hon. J. D. Hazen, Minister of Marine on October 17, and discussed with them important matters relating to the autumn grain movement, water carriage rates on the lakes, American competition, grain storage facilities, life-saving appliances on vessels, and other matters.

The deputation strongly urged that the recent increase in the tonnage of the Canadian-owned vessels on the lakes were sufficient to handle the Western grain crop movement at reasonable rates, and that there should be this autumn no repetition of the action taken by the Government last year in suspending the coastal trade regulations so as to permit American vessels to enter into the Canadian coastal trade and carry off more than their fair share of the grain cargoes.

Hon. Mr. Foster, while not giving the deputation any positive assurance, intimated that the Government, in view of the improved conditions, did not anticipate that it would be necessary to rescind the coastal regulations again this year.

The delegation representing the Dominion Marine Association comprised the following:—Messrs. L. Henderson, Montreal; A. E. Mathews, Toronto; H. W. Richardson, Kingston; George E. Fair, Collingwood; A. A. Wright, Toronto; E. E. Horsey, Kingston; S. V. McLeod, Sault Ste. Marie; D. Murphy, Ottawa; J. W. Norcross, Toronto; James Playfair, Midland; Frank Plummer, Toronto; F. S. Wiley, Port Arthur, and Captain Bassett, Toronto.

C.P.R. AND AUSTRIAN GOVERNMENT.

IN connection with the Austrian situation, the following official statement has been issued by the Canadian Pacific Railway Co. in Montreal:—

Seeing that considerable misconception appears to exist as to the nature of the activities of the Canadian Pacific Railway on the Continent of Europe, it should be explained that in conducting its passenger business, strict instructions have been issued to all Canadian Pacific agents on the Continent of Europe to follow strictly the letter of the law in their respective countries, as it has always been the desire and policy of the Canadian Pacific Railway to conform without question to the wishes of the Governments of the countries in which these agents are permitted to do business.

In the case of Austria, the Canadian Pacific Railway, knowing the natural dislike of the Austrian Government to the heavy emigration over its frontiers, went out of its way to show the Austrians how they could control that emigration—namely, by concentrating the stream on the Austrian port of Trieste, where careful examination could be made of the emigrant's antecedents and papers. It was also recommended that Austrian Government inspectors should travel on all steamers from Trieste to ensure the proper treatment of Austrian subjects on the voyage, and to prevent the possibility of exploitation by undesirables.

Such examination and protection could not be effectively made under previous conditions, where emigrants could leave by so many different frontier stations, thereby making effective control impossible. The Canadian Pacific Railway obtained its concession for emigration business in Austria purely as a carrying Company, and has strictly forbidden its agents to conduct or promote any propaganda whatever in favor of emigration, the tickets issued being almost entirely prepaid by friends and relatives who have settled in Canada or the United States, and who would, therefore, have left their native country in any case.

Passenger offices were established in Austria with the consent of the Austrian Government, and the Canadian Pacific agents were in each case approved of, and in some cases were even nominated both by the central authority in Vienna and by the local authorities in the respective provinces, the object being to prevent any possible abuse by irresponsible agents.

The line of steamers established by the Canadian Pacific Railway from Canada to Trieste was put on at the direct request of the Austrian Government in order that the merchandise business between Austria and Canada might be shipped direct from an Austrian port.

The carriage of Austrian subjects by all Canadian Pacific steamship lines this year have amounted to only 11,961, as against 14,000 in 1912. This is but a small percentage as compared to the carryings of the Continental Pool lines, which numbered 109,123 in 1911 and 201,294 in 1912.

THE MARINE MOTOR IN CANADA.

NOTWITHSTANDING the financial stringency which is affecting Canada to a marked degree, this is a wonderful year so far as motor-boating is concerned, says the "Motor Ship and Motor Boat." Naturally, when money is tight, people economize on their pleasures, and no doubt the industry has been affected in common with other branches of commerce, but there are now more boats in use than at any other period. From the Atlantic to the Pacific, the reports are practically all to this effect.

Canada a Good Market.

Canada is a splendid market for all types of boats and engines. For the thousands of boats on the Inland Lakes, the demand is chiefly for small horsepower engines, while, on the St. Lawrence, the types are from the tiny pleasure boat up to the passenger and trade craft requiring Diesel engines. On the Atlantic, the fishermen are the best customers, and on the Pacific coast we find many boats, chiefly of the cruiser type, fitted with heavy-duty engines. They are very strongly constructed, for the coast is rugged. Motor-boat racing is becoming more popular every year, and this season has been notable for the increase of hydroplanes.

The Engine Market.

In this expanding motor-engine business, British firms have, unfortunately, very little share. It is true that several are represented on this side, but their productions are not pushed. Apparently, British firms are content to allow the Americans to secure the bulk of the trade without even an effort to divert it. Most of the better-known United States makers have agents in the principal cities and towns—and they may be given the credit for advertising and pushing their goods. They freely use trade papers, and also—which is important—have stocks on hand. Many dealers admit that if buyers desire a first-class engine, and will pay the price, nothing can beat British goods, but there is little on the market to compete with the comparatively cheap Canadian and American engines, which too often have to be scrapped after a short period of working.

In connection with British engines, it may be mentioned that the Thornycroft-engined cruiser owned by Mr. Cockburn, of Montreal, is to be used for a trip up the Labrador coast to Hudson's Bay. She will be the first internal-combustion-engine-driven craft to visit this wild district.

Sir Charles Ross, of Quebec, is having a cruiser built in Scotland in which two Thornycroft engines of the paraffin type will be installed. Sir Charles already owns a cruiser fitted with a Thornycroft engine.

A 100 h.p. Thornycroft engine has been purchased by Mr. Mark Workman, of Montreal. This is installed in a cruiser-type runabout hull of solid mahogany, 36 ft. long by 6 ft. beam, and is in use on the Rideau Lakes, Ottawa. The boat has a speed of just over 26 miles an hour.

The Canadian Government has given a contract to V. M. Dafoe, of Vancouver, to construct a motor lifeboat for use at Vancouver Island. The cost is $10,000. She will be the first of the kind to be constructed in Canada, the policy of the Administration now being to have all vessels for Government service built in Canada. The vessel will be the third of the type actually in service. They are 36 ft. ocean-going vessels, unsinkable and self-righting.

"Ankle Deep," representing the Lake George Racing Association, is the winner of the gold challenge cup of the American Power Boat Association, which means that the cup leaves the shores of the St. Lawrence after being there for nine years. Many Canadians were present at the race at Alexandria Bay. "Ankle Deep came in ahead on two following days, and on the second day did the 30 miles in 47 mins. 29 secs. The cup was defended by "Mitt II.," on behalf of the Thousand Island Yacht Club, the holders. On the second day, after an excellent start, she broke down completely, owing to a crank-shaft breaking, and had to be towed to the shore. The "P.D.Q. III.," a new hydroplane, owned by Mr. A. Graham Miles, of New York, also competed.

SHIPBUILDING AT VANCOUVER.

IN the opinion of Sir Philip Watts, K.C.B., adviser on naval construction to the British Admiralty, who arrived in Vancouver, Sept. 29, warships of the larger classes could be built in Canada, but not as quickly or cheaply as they are turned out in England.

The best way, he declared, for Canada to start in on naval construction would be to have a few ships built in England at first and then have some built, partly in England and partly in Canada, and finally, when the workmen have been trained and the shipbuilding plants properly organized and equipped here, to build the ships altogether in Canada.

"Of course," he said, "the whole work could, no doubt, be done in Canada from the outset, but I think that the cost would be very great and the ships would take a much longer time to construct than is the case in England."

Building of the ships, however, he remarked, would not be the only thing that would have to be taken into consideration. There would be the machinery to build and instal, and the most important item of arming the ships when completed. At present Canada has not the facilities to do either of these things, he claimed.

Sir Philip Watts, K. C. B., F. R. S., Hon. LL.D., was born in 1850. He was educated at the College of Naval Architecture, and was a Constructor for the Admiralty until 1885, when he joined the firm of Armstrong, Whitworth & Co., and was in charge of the warship building department of that company. In 1901 he was offered and accepted the post of Director of Naval Architecture to the Admiralty, a position he filled until 1911, when he retired, and was appointed advisor to the Admiralty on Naval Construction. He is Chairman of the Federation of Shipbuilders. Sir Philip was created a knight in 1905 in recognition of his services to the Admiralty.

LINE NORTH TO SKAGWAY.

THE establishment of a steamship line by the White Pass and Yukon Route in conjunction with one of the big American railways, probably the Chicago, Milwaukee & St. Paul system, in order to provide the Northern Transportation Co., with a direct service between Seattle, Vancouver and Fairbanks, Alaska, early next year, and the eventual linking up of one of the American transcontinental railways with the Yukon and Alaska with the Pacific and Great Eastern and the Grand Trunk Pacific Railways are foreshadowed.

Although no definite information is forthcoming at present on the point the trend of the negotiations would seem to indicate that the proposed steamship line, which it is said on reliable authority, will be operated in conjunction by the W. P. & Y. R. and the Chicago, Milwaukee and St. Paul Railway, would establish a direct service by water between the present terminus of the Chicago, Milwaukee & St. Paul Railway and the White Pass and Yukon Route, which would be superseded later on by the proposed direct overland railway.

The Chicago, Milwaukee and St. Paul, as is generally known, plans to extend its system to Vancouver, where it is understood, it would connect with the Pacific and Great Eastern Railway and the Grand Trunk Pacific, and be linked up eventually with the White Pass line and the proposed links of the latter in Alaska and the Yukon.

SAFETY OF LIFE AT SEA.

MR. ALEXANDER JOHNSTON, Deputy Minister of Marine and Fisheries, has been appointed by the Government to represent Canada at the International Conference for Safety of Life at Sea to be held in London on November 12, 1913. Mr. Johnston will sail from Canada on October 28, 1913, and will be invested with full powers to sign any Convention which may be deemed necessary.

This conference is one of great importance, as the result of the investigations and inquiries consequent upon the Titanic disaster will be placed before it. The British Board of Trade, it is understood, will have important proposals to make, as will also the representatives of the other great shipping nations. It is probable that many of these proposals will be adopted by the Government of Canada acting in conjunction with the British Board of Trade.

The matter of adopting means to secure the greater safety of life at sea since the Titanic disaster and other accidents has been engaging the attention of the Dominion Government, through the Marine Department. Both the Hon. J. D. Hazen, Minister of Marine and Fisheries, and Mr. Johnston have studied the matter carefully. A list of questions bearing upon the safety of life at sea and upon better means to secure it was sent out by the Department recently to the shipping companies of Canada, which are co-operating heartily on the subject.

THE SPEED OF MOTOR BOATS.

PEOPLE who have seen that speeds of 48 and 49 knots were achieved by the motor boats which raced recently in the Solent for the British International trophy are, no doubt, wondering why in much bigger craft—destroyers, for example—ordinary shipbuilders and engineers cannot do correspondingly well. Of the seven vessels which took part in the contest two—Maple Leaf IV. and Disturber III.—are close upon 40 ft. long; two—Izme and Crusader—are 33 ft.; one—Ankle Deep—is 32 ft.; one—Despujols II.—is 29 ft. 6 in.; and one—Despujols I.—is 23 ft. The horsepower of Maple Leaf's two engines is 750, and that of Disturber's six engines is 600. Each of the French vessels is of 400 h.p., and Ankle Deep, Crusader and Izme are each of 300 h.p. The average speed of the slowest of the seven over a course of 32.4 sea miles was nearly 42 knots, and that of the smallest at her best was about 5 knots better.

These high speeds are, however, due to the fact that, without exception, the vessels are hydroplanes. Four of the seven are variations of the Fauber idea—multi-stepped skimmers—and three are variations of the idea first embodied by Sir John Thornycroft in Miranda III. Crusader is, however, the only true Thornycroft skimmer of the three, Despujols I. and Despujols II., although single-step vessels, being more like what the Americans call "sea sleds."

Unfortunately, the skimmer idea cannot be applied to much bigger vessels than Maple Leaf and Disturber, which are almost up to the 40 ft. limit prescribed by the trophy rules. M. Fauber and, if our memory serves, Sir John Thornycroft as well, have expressed the opinion that hydroplanes of more than 15 metres—50 ft. in length—are impracticable. Judging from the case of Brunhilde, that seems, however, to be an over-estimate. The limit is some way short of 50 ft., so that there is not any immediate chance of the Atlantic records being wrested from the Mauretania and the Lusitania by a leviathan skimmer. Moreover, people who incline to think that the Royal Navy ought to employ a hundred or so of Maple Leafs for scouting had better defer coming to definite decisions on the subject until they see next year's races for this trophy.

Maple Leaf's gear makes a pleasant sort of noise, and the Wolseley engine in Izme is comparatively silent, but the machinery of all the others, especially that of the French boats, make a dreadful racket, which would speedily discover them to an enemy.

The truth is that all these high-speed motor crafts are just boxes of engines, and of no utility otherwise than in races. The makers of the petrol engines certainly deserve a great deal of credit for the efficiency to which they have brought that type of internal-combustion engine, but the speed for which the vessels driven by them are best known is, it should not be overlooked, very largely due to the hull forms.—Syren and Shipping.

TESTING LARGE WATT-HOUR METERS.

THE testing of a large watt-hour meter is much more troublesome than that of a small watt-hour meter. The difficulties in making the test increase, perhaps, as the square of the load to be measured, if the difficulties may be regarded as being capable of numerical expression.

In the first place, the small flexible leads and wires of the small instrument are replaced by massive rigid bars or cables on the large instrument; so that it takes much more time to insert the testing apparatus in the circuit.

In the second place, any change in the geometrical disposition of bars or cables may alter the magnetic field at the tested instrument and thus affect its behavior. Moreover, owing to the large money value of the energy delivered by a large watt-meter, a higher degree of precision in its testing and checking is desirable. It thus comes about that the calibration of large watt-hour meters in place is an undertaking requiring considerable effort and care, even if their working loads are steady. If their working loads are rapidly fluctuating, as on a traction system, standard indicating watt-meters become unsuitable, and standard watt-hour meters are necessary.

The Foundrymen's Convention and Equipment Exhibition

This double function continues to grow in importance and popularity each succeeding year, and it is becoming increasingly apparent that its sphere of influence is widening out to an extent undreamt of by those originally responsible for the ventures. Operative foundrymen and foundry equipment manufacturers are to be congratulated upon the enthusiasm exhibited in the welfare of their old time craft, and upon their evident determination to keep going in the direction of still greater achievement.

CHICAGO was the Mecca of foundrymen and kindred trades representatives during the week of October 10 to 17, for not only were the Annual Conventions of the American Foundrymen's Association, the American Institute of Metals, and that of the Associated Foundry Foremen being held in the "Windy" City, but there was also installed in the International Amphitheatre there, the most comprehensive exhibit of foundry apparatus, equipment and accessories, supplemented by a varied and most modern machine tool display, yet gathered together under one roof in any part of the world.

That something surpassing the ordinary was anticipated was clearly evidenced by the registration record of each section. The Convention Headquarters of the Allied Foundrymen's Associations found location in the Hotel La Salle, and there from October 14 to 17, morning and afternoon sessions were held, at which the reading of papers relative to the different spheres of the foundry industry and discussions thereon took place.

Convention Programme.

Tuesday, October 14, 10 a.m.—Joint session of American Foundrymen's Association, American Institute of Metals and the Associated Foundry Foremen.

Addresses of welcome and responses.

Reports of officers of the three Associations.

Reports of committees, American Foundrymen's Association.

2 p.m.—Joint session.

Address, "Apprenticeship System in the Metal Industries," by M. W. Alexander, Lynn, Mass.

Address, "How to Make a Time Study," by C. E. Koeppel, New York City.

American Institute of Metals:

Report of Official Chemist, by C. F. Woods.

Report of Bureau of Mines, by Dr. C. L. Parsons.

Report of Bureau of Standards, by G. H. Clamer.

Internal Strains in Bronze Castings, by J. E. Howard.

Work in Metals of the Bureau of Standards, by G. K. Burgess.

Nomenclature of non-ferrous alloys, by G. K. Burgess.

The Brass Foundry of the Future, by C. Powell Karr.

Wednesday, October 15, 10 a.m.—American Foundrymen's Association:

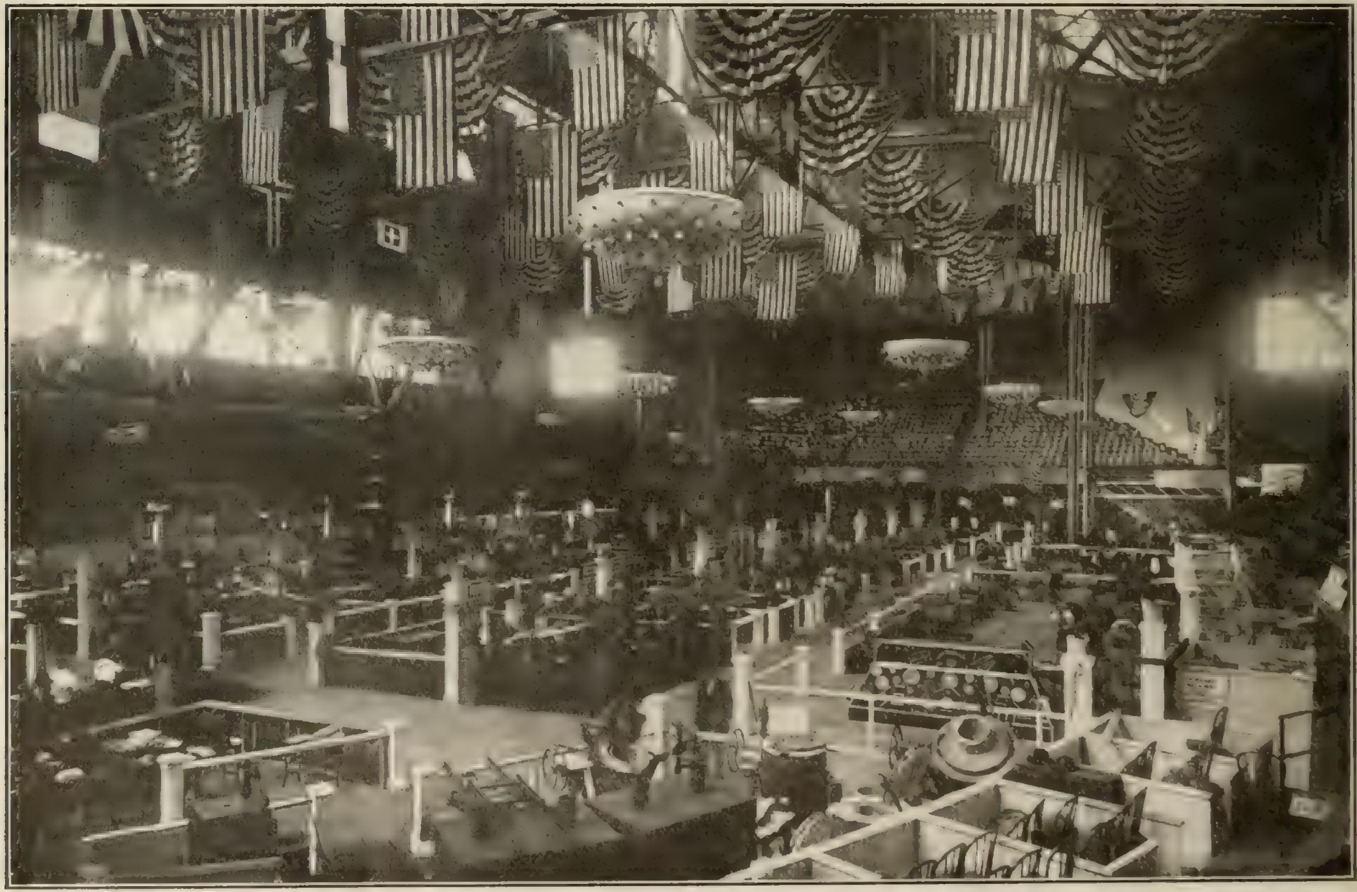
Gray Iron for Motor Car Castings, by H. B. Swan, Detroit, Mich.

Electric Steel Castings, by F. T. Snyder, Chicago.

Some Difficulties in Pouring Steel Castings, by R. A. Bull, Granite City, Ill.

The Pattern Shop as Related to the Steel Foundry, by E. R. Swanson, Granite City, Ill.

Some Observations on Miniature, or Detachable Open-hearth Furnaces, by W. M. Carr, Erie, Pa.



FOUNDRY AND MACHINE EXHIBITION, INTERNATIONAL AMPHITHEATRE, CHICAGO, 1913.

The Electric Furnace for Steel Castings, by Albert Hiorth, Christiania, Norway.

On the Influence of Changing the Composition of Malleable Cast Iron, by P. Rodigin, Berdiansk (Sea of Azow), Russia.

A Study of the Annealing Process for Malleable Castings, by E. L. Leasman, Boscobel, Wis.

Malleable Troubles, by Dr. Richard Moldenke, Watchung, N.J.

10 a.m.—Associated Foundry Foremen, annual meeting.

12 noon.—Luncheon to ladies at Marshall Field & Co.

2 p.m.—Complimentary performance to visiting foundrymen at Bismarck Garden.

2 p.m.—Theatre party for ladies.

Thursday, October 16.—10 a.m.—American Foundrymen's Association:

The Need of Standard Specifications for Cast Iron, by R. S. MacPherran, West Allis, Wis.

Memoranda on Automobile Cylinder Founding, by Robert Crawford, Detroit, Mich.

Core Test and Specifications, by H. M. Lane, Detroit, Mich.

Testing Molding Sands under Commercial Conditions, by Prof. E. A. Johnson, Boston, Mass.

Vital Points in Foundry Practice, by J. J. Wilson, Detroit, Mich.

The Carnegie Institute of Technology, by Dean C. B. Connelley, Pittsburgh, Pa.

"Put Your House in Order," by Frederic A. Parkhurst, M.E., Detroit, Mich.

The Need of a Common Sense Cost System for the Foundry, by E. W. Riker, New York City.

10 a.m.—American Institute of Metals:

Efficiency Engineering in the Foundry, by E. A. Barnes.

Scientific Management, by W. M. Corse.

Scientific Management, by F. A. Parkhurst.

How Scientific Management Works in Our Plant, by C. B. Bohn.

Core Room Economics, by O. F. Flumerfelt.

Boiling of Metals, by Dr. J. W. Richards.

2 p.m.—American Foundrymen's Association:

Iron, Where Does It All Go To? by D. C. Wilson, Newark, N.J.

On the Relative Value of Foundry Flour, with Simple Methods of Testing, by G. S. Evans, Lenoir City, Tenn.

Memoranda on Accident Prevention, by Thos. D. West, Cleveland.

The Use of Powdered Coal as Fuel, by W. S. Quigley, New York City.

Memorandum on the Centrifugal Blower for the Foundry, by Dr. Richard Moldenke, Watchung, N.J.

Oxy-acetylene Welding and Cutting, by W. S. Hoyt, Chicago, illustrated by lantern slides.

Unfinished and new business, election of officers, etc.

7 p.m.—Annual subscription banquet at the La Salle Hotel.

Friday, October 17.—10 a.m.—American Institute of Metals:

Producer Gas for Brass Melting, by E. F. Bulmahn.

Commercial Operation of the Hering Furnace, by G. H. Clamer.

Silver Plating and Spotting Out, by C. F. Burgess.

Fluxes for Soft Solders, by W. Arthur.

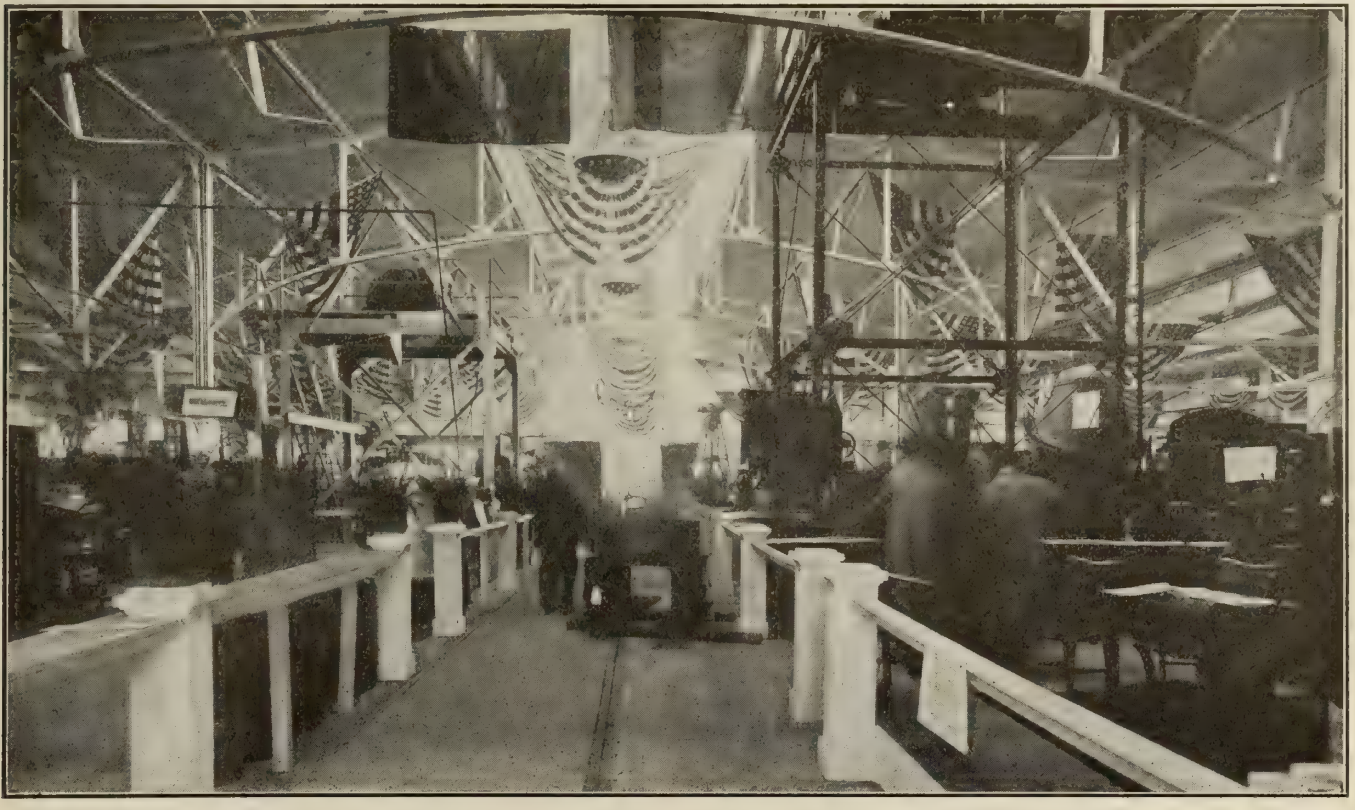
Aluminum Solders, by W. Arthur.

Approximate Melting Points of Some Commercial Alloys, by A. B. Norton and H. W. Gillett.

In succeeding issues of our journal, publication will be made of abstracts from the various Papers read; it will, therefore, be unnecessary to refer to these here, except in so far as an obvious trend in some features of foundry practice betterment appear to us as being more prominent than others.

Efficiency and Scientific Management naturally took a prominent place in the subject matter of a number of Papers read, and it is not assuming too much when we say that active and successful application of these up-to-date practices is becoming a feature in both large and small foundry plants, with resultant benefit to employer and employee.

The development of the automobile found expression in some of the Papers read; its call for light, strong, clean close-grained castings, etc., being the



NORTH BUILDING ANNEX, FOUNDRY AND MACHINE EXHIBITION.

signal to foundrymen and their associates that investigation and scientific systematic treatment of the molding and metallurgical sides of the craft are sine qua non of the future of that growing industry.

The Production of Steel Castings by the Electrical Process, the Malleable Casting Process, Oxy-Acetylene Welding, Apprenticeship Systems and the question of Industrial Education occupied, among others, a large place in the future betterment problems more or less in the forefront of present-day foundry practice.

A.F.A. Officers, 1913-1914.

The officers of the American Foundrymen's Association elected for the ensuing year were as follows:

President—Alfred E. Howell, Phillips & Buttorff Mfg. Co., Nashville, Tenn.

Vice-Presidents—R. A. Bull, Commonwealth Steel Co., Granite City, Ill.; H. A. Carpenter, General Fire Extinguisher Co., Providence, R.I.; S. B. Chadsey, Massey-Harris Co., Ltd., Toronto, Ont.; G. R. Lombard, Lombard Iron Works & Supply Co., Augusta, Ga.; T. L. Richmond, Buffalo Scale Co., Buffalo, N.Y.; T. W. Sheriff, Sheriff's Mfg. Co., Milwaukee, Wis.; J. J. Wilson, Cadillac Motor Co., Detroit, Mich.; Walter Wood, R. D. Wood & Co., Philadelphia.

Secretary - Treasurer — Dr. Richard Moldenke, Watchung, N.J.

A.I.M. Officers, 1913-1914.

For the American Institute of Metals the following officers were chosen:

President—G. H. Clamer, Ajax Metal Co., Philadelphia.

Secretary-Treasurer—W. M. Corse, Lumen Bearing Metal Co., Buffalo, N.Y.

Vice-Presidents—For rolling mills—W. H. Bassett, American Brass Co., Waterbury, Conn.; for Michigan and Ohio, F. O. Clements, National Cash Register Co., Dayton, Ohio; for Ontario and Western Canada, C. H. Ivey, Empire Mfg. Co., London, Ont.; for Quebec, Robert Job, Milton Hersey Co., Montreal, Que.; for Pennsylvania, Jesse L. Jones, Westinghouse Electric & Mfg. Co., East Pittsburg, Pa.; for New England, Dr. E. Weintraub, General Electric Co., West Lynn, Mass.; for Chicago and Wisconsin, Fred Moerl, Pullman Co., Chicago; for Illinois, exclusive of Chicago, Phillip Mueller, Decatur, Ill.; for New York and New Jersey, C. A. Finnegan, Empire Smelting Co., Depew, N.Y.; for Virginia and South, E. S. Fretz, Light Foundry & Mfg. Co., Pottstown, Pa.

H. W. Gillett was appointed chairman of the Programme Committee.

A.F.F. Officers, 1913-1914.

The officers of the Associated Foundry Foremen elected are as follows:—

President—S. V. Blair, Kalamazoo Stove Co., Kalamazoo, Mich.; Vice-President, H. M. Martin, Davis Foundry Co., Hornell, N.Y.; Secretary-Treasurer, Robert B. Thompson, Buffalo Pitts Co., Buffalo, N.Y.

Foundry and Machine Exhibition Co. Officers.

F. N. Perkins, President; R. S. Buch, vice-president; J. S. McCormick, treasurer; C. E. Hoyt, Secretary.

Directors:—R. S. Buch, A. Buch, Sons Co., Elizabethtown, Pa.; F. N. Perkins, Arcade Mfg. Co., Freeport, Ill.; George R. Rayner, The Carborundum Co., Niagara Falls, N.Y.; J. S. McCormick, J. S. McCormick Co., Pittsburgh, Pa.; E. H. Mumford, Mumford Molding Machine Co., 30 Church St., New York City; A. M. Frauenheim, Herman Pneumatic Machine Co., Zelienople, Pa.; Henry A. Pridmore, Henry E. Pridmore, Chicago, Ill.; H. R. Atwater, The Osborn Mfg. Co., Cleveland, Ohio.; Wilfred Lewis, The Tabor Mfg. Co., Philadelphia, Pa.; Edward A. Pridmore, International Molding Machine Co., Chicago, Ill.; J. W. Campbell, The Cleveland Wire Spring Co., Cleveland, Ohio; C. E. Hoyt, Lewis Institute, Chicago, Ill.

Next Year's Meeting Place.

At an informal meeting of the officers of the American Foundrymen's Association, the American Institute of Metals and the Associated Foundry Foremen, it was decided that future Conventions would be held in the Spring rather than in the fall—probably in May.

Since the annual meeting has been shifted to the fall instead of the spring, the securing of Papers for the meetings has become more difficult, due to the fact that members will not write them during their vacation time.

The Foundry and Machine Exhibition Co. has not yet decided whether it will have its exhibition in the fall next year, or whether it will follow the practice of having it at the same time and place as the Foundrymen's Association Conventions.

FOREIGN BRANCH

PART OF THE MACHINE TOOL EXHIBIT, FOUNDRY AND MACHINE EXHIBITION.

The cities sending special invitations to the Associations were Nashville, Chattanooga, New York, Philadelphia, Kansas City, St. Paul, Denver, Atlantic City and Columbus.

Presentation.

The newly elected president, on behalf of the Convention, presented J. S. Seaman, of Pittsburgh, the oldest living ex-president of the Association and the "daddy" of the crowd, with a beautiful silver pitcher and tray. A number of goodfellowship speeches followed.

As in former years the local committees bore a large part in the successful outcome of the joint function of Convention and Exhibition, and in this connection, the chairman of the local executive, Mr. Chas. A. Plamondon, the chairmen of the Entertainment, Reception, Finance, Publicity and Ladies' Committees, are deserving of special mention, and while the secretarial work of the Foundrymen's Association, and that of the Foundry & Machine Exhibition Co., keeps piling up, there is abundant evidence that the officers in these positions—Dr. Richard Moldenke and Mr. C. E. Hoyt, always rise to the occasion, and look good for the inevitable extension of their respective undertakings, for many years to come.

The Canadian Delegation.

J. A. Meuris, Iron Foundry Foreman, Jenkins Bros., Montreal, Que.

Ed. Halley, Purch. Agent, Lymburner, Ltd., Montreal, Que.

A. Knight, Fdry. Supt., Manitoba Bridge & Iron Works, Winnipeg, Man.

W. L. Churchill, Gen. Supt., McKinnon Dash Co., St. Catharines, Ont.

Frank T. Young, Adv. Rep., MacLean Publishing Co., Toronto, Ont.

R. H. Turner, Fóundry Supt., Nova Scotia Steel & Coal Co., Sydney Mines, N.S.

H. V. Sprecken, Foundry Supt., Otis Fensom Elevator Co., Hamilton, Ont.

P. A. Vansickle, Designer, Verity Plow Works, Brantford, Ont.

W. J. Verity, Gen. Mgr., Verity Plow Works, Brantford, Ont.

John W. Battershill, Supt., Vulcan Iron Works, Winnipeg, Man.

J. M. Taylor, Supt., Western Steel & Iron Works, Elmwood, Winnipeg, Man.

W. R. Gilmore, Manager, Canadian Steel Foundries, Welland, Ont.

F. E. Smith, Mgr., Canadian Steel Foundries, Montreal, Que.

Geo. M. Weaver, Mgr. Dominion Foundry Supply Co., Montreal, Que.

A. Earsman, Mgr., Earsman Bros., Toronto, Ont.

A. J. Palmer, Supt., Empire Mfg. Co., London, Ont.

C. M. Ivey, Sec., Empire Mfg. Co., London, Ont.

J. B. Walton, Supt., McClary Mfg. Co., London, Ont.

M. F. Irwin, Mgr., McClary Mfg. Co., London, Ont.

A. J. Oliver, Mgr. and Sec., R. McDougall Co., Galt, Ont.

S. B. Chadsey, Asst. Gen. Supt., Massey-Harris Co., Toronto, Ont.

A. H. Byrne, Chicago Rep., MacLean Publishing Co., Toronto, Ont.

R. Cecil Cowan, Purch. Agt., Ontario Malleable Iron Co., Ltd., Oshawa, Ont.

J. R. Phillips, Supt., Pease Foundry Co., Toronto, Ont.

J. G. McKinnon, Sec., Pease Foundry Co., Toronto, Ont.

P. J. Vernon, Supt., Pratt & Letchworth Co., Ltd., Brantford, Ont.

A. Chase, Foreman, Sawyer-Massey Foundry, Hamilton, Ont.

Arthur Woodley, Mgr., Standard Foundry, Toronto, Ont.

Jno. M. Taylor, Jr., Asst. to the Pres., R. Saville, Supt., A. R. Hocken, Supt., and Capt. J. S. Taylor, Mgr., Boiler Dept., Taylor-Forbes Co., Guelph, Ont.

T. Tomlinson, Prop., Tomlinson & Son, Toronto.

F. W. Armstrong, Mgr., Toronto Brass Mfg. Co., Toronto, Ont.

J. Van Iderstein, Foreman, and C. F. Verity, Vice-Pres., Verity Plow Co., Brantford.

J. Poulson, Pattern Maker, and J. Robinson, Fdry. Foreman, Warden-King, Ltd., Montreal, Que.

W. D. Varey, Vice-Pres., J. J. Cunningham, Pres. and Gen. Mgr., Western Foundry Co., Ltd., Wingham, Ont.

A. L. F. Beauchemin, Mgr., Beauchemin & Fils, Sorel, Que.

T. K. Smith, Supt., Big Four Trans. & Storage Co., Winnipeg, Man.

Hugo A. Gutenkunst, Pres. and Treas., Can. Malleable Iron Co., Owen Sound, Ont.

Robt. Gordon, Supt., Canada Mach. Corp., Galt, Ont.

Albert Beauchemin, Mgr., Dominion Foundry, Sorel, Que.

John A. Kittilson, Res. Mgr., the E. & T. Fairbanks & Co., Sherbrooke, Que.

T. W. Kirdy, Mgr., and A. C. Spencer, Works Mgr., Hamilton Stove & Heater Co., Hamilton, Ont.

Rupert G. Bunce, Mgr., Manson & Van Winkle Co., Toronto.

Wm. Inglis, Managing Director, John Inglis Co., Toronto, Ont.

Chas. Linklater, Foreman, International Harvester Co., Hamilton, Ont.

J. F. Gramp, Pres., National Brass Co., London, Ont.

V. C. Writtenhouse, Fdry. Foreman, Sawyer-Massey, Ltd., Co., Hamilton, Ont.

W. Quinn, Foreman, M. Callander, Foreman, and Adam Taylor, Treas., Taylor-Forbes Co., Ont.

Robert Dawe, Foundry Supt., Can. Car & Foundry Co., Ltd., Montreal, Que.

C. E. Rohder, Vice-Pres. and Asst. Mgr., F. Bowman Co., Bowmanville, Ont.

A. Knight, Foundry Supt., Manitoba Bridge & Iron Co., Winnipeg, Man.

D. McKinnon, Gen. Foreman, Montreal Steel Works, Montreal, Que.

R. Wilson, Works Mgr., Otis Fensom Elevator Co., Ltd., Hamilton, Ont.

R. Morton Hamilton, Asst. Supt., and Jas. M .Smith, Supt., Sheldons, Ltd., Galt, Ont.

Allen Murray, Foreman, Jas. Smart Mfg. Co., Brockville, Ont.

J. C. King, Pres., and Frank E. Lauer, Works Supt., Warden King, Ltd., Montreal, Que.

W. G. Harris, the Canada Metal Co., Toronto, Ont.

D. Maxwell, Pres., D. Maxwell & Sons, St. Mary's, Ont.

❖

Vancouver, B.C.—Judge McInnes, on October 15, decided in the case of Mrs. Hill against the Victoria Lumber Co., that a logging camp was neither a "factory" nor "engineering works," as defined by the Workmans' Compensation Act. The effect of this decision is that no one injured in a logging camp can claim compensation, nor relatives of the man in case of death, under this Act. This has been a moot question among lawyers ever since the passing of the Workmans' Compensation Act in British Columbia, and this decision directly upon it settles the point.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, October 27, 1913.—Generally speaking, trade conditions may be said to show an improved tone over last week, particularly in the machine tool line. This is the more gratifying, as machinery brokers have not been getting the amount of business that might have been expected during the past month or two. Last week, the Canadian Allis-Chalmers Co. secured a nice order for turbine pumps for the Abitibi Pulp and Paper Co., while Mussens, Limited, sold about $12,000 worth of machine tools to the Dominion Dredging Co., who are erecting a very fine repair shop at Port Welland in connection with their work on the new Welland canal.

The large machinery houses here are looking forward to an early issuing of specifications for the equipment for the new shops of the National Transcontinental Railway at St. Malo, near Quebec. Work on these shops has now commenced and the specifications for the equipment may be expected any time now. There will, of course, be a large sum of money involved and doubtless competition for the orders will be keen.

Metals.

Business in pig iron continues brisk. First deliveries from the new furnace at Port Colborne, Ont., are now arriving and will doubtless be given a careful try-out in local foundries.

The price of copper shows a slightly firmer tendency, but the market in this metal, and also in tin and lead, is very dull.
